CDC Urging Dialysis Providers and Facilities to Assess and Improve Infection Control Practices to Stop Hepatitis C Virus Transmission in Patients Undergoing Hemodialysis

Summary

The Centers for Disease Control and Prevention (CDC) has received an increased number of reports of newly acquired hepatitis C virus (HCV) infection among patients undergoing hemodialysis. Infection control lapses in dialysis care could expose patients to HCV. Any case of new HCV infection in a patient undergoing hemodialysis should prompt immediate action. CDC is urging dialysis providers and facilities to:

1) Assess current infection control practices and environmental cleaning and disinfection practices within the facility to ensure adherence to infection control standards;
2) Address any gaps identified by the assessments;
3) Screen patients for HCV, following CDC guidelines, to detect infections, determine treatment potential, and halt secondary transmission; and
4) Promptly report all acute HCV infections to the state or local health department.

Background

CDC has received an increased number of reports of acute HCV infection among patients undergoing hemodialysis. Between 2014 and 2015, CDC has been contacted about 36 cases of acute HCV infection in 19 different hemodialysis clinics in eight states. While investigations are ongoing, so far, HCV transmission between patients has been demonstrated at nine of those clinics, based on epidemiologic and viral sequencing evidence. Lapses in infection control (e.g., injection safety, environmental disinfection, and hand hygiene) were commonly identified at these facilities. Although the exact means of transmission could not be discerned, these lapses all could potentially contribute to HCV transmission. The increase in acute HCV infections might be due, in part, to improved screening and awareness of the potential for HCV infection in the hemodialysis setting. Regardless, this increase underscores the widespread potential for patients to acquire serious infections during dialysis care. Dialysis facilities should actively assess and continuously improve their infection control, environmental cleaning and disinfection, and HCV screening practices, whether or not they are aware of infections in their clinic. Any case of new HCV infection in a patient undergoing hemodialysis is likely to be a healthcare-associated infection and should be reported to public health authorities in a timely manner. A recent publication describes a dialysis facility where an outbreak of HCV continued for five years before being detected, highlighting the importance of HCV screening to identify these infections early and prevent further transmission.\(^1\) HCV transmission can be prevented when proper infection prevention and environmental disinfection practices are consistently followed.
Recommendations

In response to the increased identification of HCV transmission in dialysis clinics, CDC recommends the following actions be followed:

**Dialysis providers**

- Evaluate infection control practices in each facility and ensure adherence to infection control standards.
  - CDC has checklists and audit tools ([http://www.cdc.gov/dialysis/prevention-tools/](http://www.cdc.gov/dialysis/prevention-tools/)) that providers can use to assess their practices, identify gaps, and improve infection control practices to protect patients.²
- If gaps are identified, promptly address any issues to protect patients’ health and safety ([http://www.cdc.gov/dialysis/](http://www.cdc.gov/dialysis/)).
- Ensure staff are aware of and trained to implement infection control guidelines ([http://www.cdc.gov/dialysis/guidelines/index.html](http://www.cdc.gov/dialysis/guidelines/index.html)) for hemodialysis settings.³⁴ Facilities should provide regular (e.g., annual) training ([http://www.cdc.gov/dialysis/clinician/index.html](http://www.cdc.gov/dialysis/clinician/index.html)) of staff to ensure adherence to infection control recommendations.³⁴
- Follow CDC recommendations for HCV screening of hemodialysis patients and management of patients who test positive:
  - CDC recommends that chronic hemodialysis patients be screened for HCV antibody 12,13 (anti-HCV) ([http://www.cdc.gov/hepatitis/hcv/hcvfaq.htm](http://www.cdc.gov/hepatitis/hcv/hcvfaq.htm)) upon admission to the dialysis clinic and every six months thereafter if susceptible to HCV infection.⁵
  - For those patients with a positive anti-HCV test result, the test should be followed with a Nucleic Acid Test (NAT) for HCV RNA.⁶ Follow CDC recommendations for interpretation of test results and further actions.⁷ Ensure patients identified to have HCV infection are aware of the diagnosis and are referred to appropriate care and evaluation. Persons with chronic HCV infection, including those with end-stage renal disease, may benefit from treatment.
- Immediately report any new cases of HCV infection among patients undergoing hemodialysis to DHEC.⁵⁸ Acute cases of HCV are urgently reportable within 24 hours to DHEC.
  - New HCV infection can present as a change in anti-HCV status from negative to positive, in the absence of signs or symptoms.
  - Communicate test results to the patient and arrange for clinical evaluation for possible treatment of HCV infection.
  - Determine the HCV infection status of all other patients receiving care in the facility.
- Be transparent. Inform patients if HCV transmission is suspected to have occurred within the facility, and explain steps being taken to address the problem.

**Public Health Department**

- The Public Health Department will investigate any acute HCV infection in a hemodialysis patient for a possible healthcare associated etiology.⁹

DHEC contact information for reportable diseases and reporting requirements

Reporting of Hepatitis C is consistent with South Carolina Law requiring the reporting of diseases and conditions to your state or local public health department. (State Law # 44-29-10 and Regulation # 61-20) as per the DHEC 2016 List of Reportable Conditions available at:

Federal HIPAA legislation allows disclosure of protected health information, without consent of the individual, to public health authorities to collect and receive such information for the purpose of preventing or controlling disease. (HIPAA 45 CFR §164.512).

Categories of Health Alert messages:
- **Health Alert** Conveys the highest level of importance; warrants immediate action or attention.
- **Health Advisory** Provides important information for a specific incident or situation; may not require immediate action.
- **Health Update** Provides updated information regarding an incident or situation; unlikely to require immediate action.
- **Info Service** Provides general information that is not necessarily considered to be of an emergent nature.
