## MMWR Week 3 at a Glance:

### Influenza Activity Synopsis:

During the last MMWR week influenza activity in South Carolina continued to decrease overall. South Carolina reported WIDESPREAD activity for week 3.

### Laboratory surveillance:

- 3,363 laboratory-confirmed cases of influenza were reported from 43 counties. This includes positive rapid tests, cultures, RT-PCRs, DFAs, and IFAs. This compares to 3,151 cases this time last year.
- 46,329 laboratory-confirmed cases have been reported this season, with cases identified in 45 counties. This compares to 31,185 cumulative cases this time last year.
- 42,998 (92.8%) of all laboratory-confirmed cases this season are influenza A, 2,423 (5.2%) are influenza B, 754 (1.6%) are influenza A/B, and 154 (0.33%) are of unknown or other type.

### ILI Activity (South Carolina baseline is 2.05%):

- Influenza-like illness activity at sentinel providers was above South Carolina's baseline (7.64%). ILI percentages represent ILI activity reported by sentinel providers; however, due to the number of reporting providers and the definition of ILI, ILI percentages may not be representative of actual flu activity.

### Hospitalizations:

- 145 lab confirmed hospitalizations were reported. 2,234 lab confirmed hospitalizations have been reported since 9/28/14.

### Deaths:

- 11 lab confirmed deaths were reported. 89 lab confirmed deaths have been reported since 9/28/14.

**Summary of ILI Activity, Positive Confirmatory Tests, and  
Influenza Associated Hospitalizations and Deaths Compared to Previous Week and Season**

\*Includes all laboratory tests (rapid antigen, culture, PCR, IFA, DFA.)

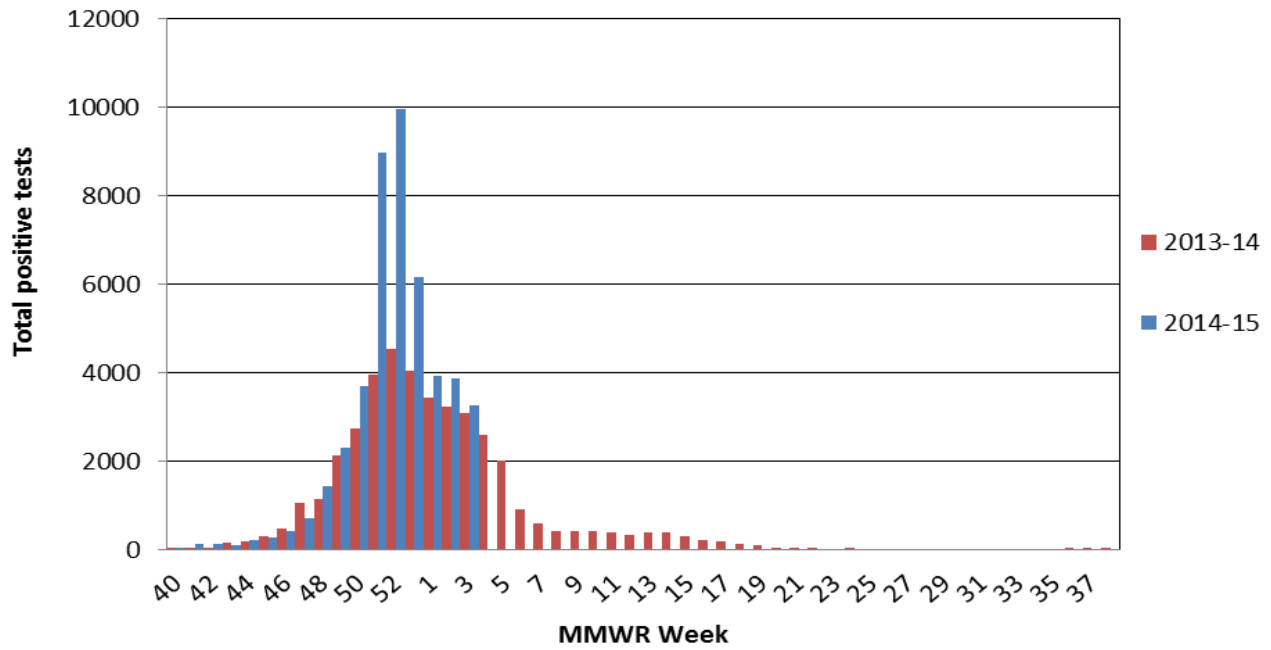

## II. Positive Rapid Antigen Tests

For the current MMWR reporting week, 3,264 positive rapid antigen tests were reported. Of these, 2,979 were influenza A, 49 were influenza A/B, 229 were influenza B, and 7 were unknown type. This compares to 3,086 this time last year. 45,618 positive rapid tests have been reported since 9/28/14.

(Current Week 1/18/15 - 1/24/15)

## Positive Rapid Tests by MMWR Week 2013-14 vs 2014-15

## Positive Rapid Tests by Type 2013-14 vs 2014-15 September 28, 2014 - January 24, 2015

### III. ILINet Influenza-Like Illness Surveillance

During the most recent MMWR week, 7.64%\* of patient visits to SC ILINet providers were due to ILI. This is above the state baseline (2.05%). This ILI percentage compares to 6.51% this time last year. Reports were received from providers in 9 counties, representing all of the 4 regions.

\*The SC baseline is the mean percentage of patient visits for ILI during non-influenza weeks (weeks when percent of positive lab tests was below 20%) for the previous three seasons plus two standard deviations. \* ILI percentage is dependent upon the number of reporting providers and can be greatly influenced by a single provider with high numbers of ILI.

**Influenza-Like Illness Reported by Sentinel Providers  
January 18, 2015 – January 24, 2015**

| <b>County</b> | <b>ILI %</b> | <b>County</b> | <b>ILI %</b> |

 ---: No enrolled providers

#### IV. Influenza hospitalizations and deaths

For the current MMWR reporting week, 145 lab confirmed influenza hospitalizations were reported by 63 hospitals. 11 lab confirmed influenza deaths were reported.\* So far this season, 2,234 lab confirmed hospitalizations and 89 lab confirmed deaths have been reported.

| <i>Current MMWR Week (1/18/15 - 1/24/15)</i> |     |      |       |       |     |     |       |

## V. South Carolina Influenza Surveillance Components

South Carolina influenza surveillance consists of mandatory and voluntary reporting systems for year-round influenza surveillance. These networks provide information on influenza virus strain and subtype and influenza disease burden.

### Mandatory Reporting

#### Positive confirmatory test reporting

Positive influenza culture, PCR, DFA, and IFA results from commercial laboratories should be reported to DHEC within 3 days electronically via CHESS or using a DHEC 1129 card.

#### Positive rapid antigen test reporting

*Summary numbers* of positive rapid influenza tests and influenza type identified should be sent to the **regional** health department by fax or email before noon on Monday for the preceding week.

#### Influenza deaths

All (pediatric and adult) lab confirmed influenza deaths should be reported to DHEC within 24 hours. These include deaths confirmed by culture, PCR, rapid test, DFA, IFA or autopsy results consistent with influenza.

#### Influenza hospitalizations

DHEC requires weekly submission of laboratory confirmed influenza hospitalizations. Hospitals should report these to their **regional** health department by noon on Monday for the preceding week.

For additional information about ILINet or to become an ILINet provider, contact the Acute Disease Epidemiology influenza surveillance coordinator at [springcb@dhec.sc.gov](mailto:springcb@dhec.sc.gov).

### Voluntary Networks

#### Influenza-Like Illness (ILINet) Sentinel Providers Network

ILINet focuses on the number of patients presenting with influenza-like symptoms in the absence of another known cause. ILI is defined as fever (temperature  $\geq 100^{\circ}\text{F}$ ) plus a cough and/or a sore throat in the absence of another known cause. Providers submit weekly reports to the CDC of the total number of patients seen in a week and the subset number of those patients with ILI symptoms by age group.

#### South Carolina Disease Alerting, Reporting & Tracking System (SC-DARTS)

SC-DARTS is a collaborative network of syndromic surveillance systems within South Carolina. Currently our network contains the following data sources: SC Hospital Emergency Department (ED) chief-complaint data, Poison Control Center call data, Over-the-Counter (OTC) pharmaceutical sales surveillance, and CDC's BioSense Biosurveillance system. The hospital ED syndromic surveillance system classifies ED chief complaint data into appropriate syndrome categories (ex: Respiratory, GI, Fever, etc.). These syndrome categories are then analyzed using the cumulative sum (CUSUM) methodology to detect any significant increases. Syndromic reports are distributed back to the hospital on a daily basis.

## VII. Definitions for Influenza Surveillance

**Activity level:** Indicator of the geographic spread of influenza activity which is reported to CDC each week.

- **No activity:** No increase in ILI activity and no laboratory-confirmed influenza cases.
- **Sporadic:** No increase in ILI activity and isolated laboratory-confirmed influenza cases
- **Local:** Increased ILI or 2 or more institutional outbreaks in one region and laboratory-confirmed influenza cases within the past 3 weeks in the region with increased ILI or outbreaks
- **Regional:** Increased ILI or institutional outbreaks in 2-3 regions and laboratory-confirmed influenza cases within the past 3 weeks in the regions with increased ILI or institutional outbreaks
- **Widespread:** Increased ILI and/or institutional outbreaks in at least 4 regions and laboratory confirmed influenza in the state within the past 3 weeks

Note: For activity level classification purposes only, the state is divided into 8 reporting regions.

**Confirmatory testing:** Influenza testing which is considered to be confirmatory, such as a viral culture, RT-PCR, DFA, IFA

**Influenza-like illness (ILI):** Fever (temperature of 100°F [37.8°C] or greater) and cough and/or sore throat

**MMWR week:** Term for influenza surveillance week. Each week begins on Sunday and ends on Monday. The influenza season begins with MMWR week 40 and ends with MMWR week 39. The 2014-15 influenza season began on September 28, 2014 and will end on October 3, 2015.

**Laboratory-confirmation:** Positive influenza test resulting from one of the following laboratory tests:

- DFA
- IFA
- Rapid influenza antigen test
- RT-PCR
- Viral culture
