APPENDIX	Individual Hospital Reports for Healthcare Worker Influenza Vaccination

## **INTRODUCTION**

HCWs are at risk of contracting the influenza virus through contact with infected patients and transmitting the virus to their patients, coworkers, and families. The benefits of HCW influenza vaccination on patient outcomes and worker absenteeism have been well documented.

Unfortunately, national influenza vaccination coverage in HCWs remains low; A CDC survey conducted during the 2011-2012 influenza season estimated influenza vaccination coverage in HCWs was 67%.<sup>1</sup>

There are currently no state regulations requiring influenza vaccination of HCWs in South Carolina healthcare facilities. However, some healthcare facilities do require HCW influenza vaccination as a condition of employment and/or credentialing. Healthcare influenza vaccination rates were monitored in 66 acute care facilities and 12 long term acute care/inpatient rehabilitation facilities (LTAC/IRF) reporting under the South Carolina Hospital Infections Disclosure Act (HIDA) during the 2012-2013 influenza season.

## **METHODS**

Facilities were required to collect HCW influenza vaccination data from October 1<sup>st</sup>, 2012 through March 31<sup>st</sup>, 2013. Data was submitted to the Healthcare Personnel Vaccination Module within the National Healthcare Safety Network's (NHSN) Healthcare Personnel Safety Component. Reporting facilities were required to follow standardized reporting definitions and methods that are described in the NHSN Healthcare Personnel Safety Component Protocol.<sup>2</sup>

Denominator data consisted of HCWs who were physically present within the healthcare facility for at least 30 working days between October 1<sup>st</sup>, 2012 and March 31<sup>st</sup>, 2013. Denominators were to be collected separately for the following HCW type:

- 1) *Employees*: This included all persons who receive a direct paycheck from the reporting facility (i.e. on the facility's payroll).
- 2) *Licensed Independent Practitioners (LIPs)*: This included physicians, advanced practice nurses and physician assistants who were affiliated with the reporting facility but not directly employed by it. Post-residency fellows were also included in this category if they were not on the facility payroll.
- 3) *Adult student, trainees, and volunteers (ASTVs)*: This includes medical, nursing, or other health professional students, interns, medical residents, or volunteers aged 18 or older who are affiliated with the healthcare facility, but are not directly employed by it (i.e., they do not receive a paycheck from the facility).

Numerator data consisted of HCWs in each denominator HCW type, who were physically present within the healthcare facility for at least 20 working days between October 1<sup>st</sup>, 2012 and March 31<sup>st</sup>, 2013, and:

- 1) received an influenza vaccine administered at the healthcare facility;
- 2) provided proof of receiving influenza vaccination elsewhere;
- 3) were determined to have a medical contraindication;
- 4) were offered but declined influenza vaccination or;
- 5) had unknown vaccination status or did not meet any of the above numerator categories.

Data for HCWs who received vaccine prior to October 1<sup>st</sup> could be included in the summary data counts.

## RESULTS

*Note: The formula used to calculate vaccination rate described in the results section of this report is:  $Vaccination\ Rate = (Total\ Vaccinated / Total\ Working) \times 100$*

### Influenza Vaccination Percentages by Facility and HCW Type

Table 1 displays influenza vaccination percentages for all HCW types for acute care facilities and for long term acute care/inpatient rehabilitation facilities (LTAC/IRF). Acute care facilities had an 82% vaccination rate and LTAC/IRFs had a 78% vaccination rate. The statewide rate for all facility types was 81%. A confidence interval is provided to assess any statistically significant difference in HCW influenza vaccination between facility types.

**Table 1. Influenza Vaccination Percentages for All\* HCW by Facility Type, 2012 – 2013 Influenza Season**

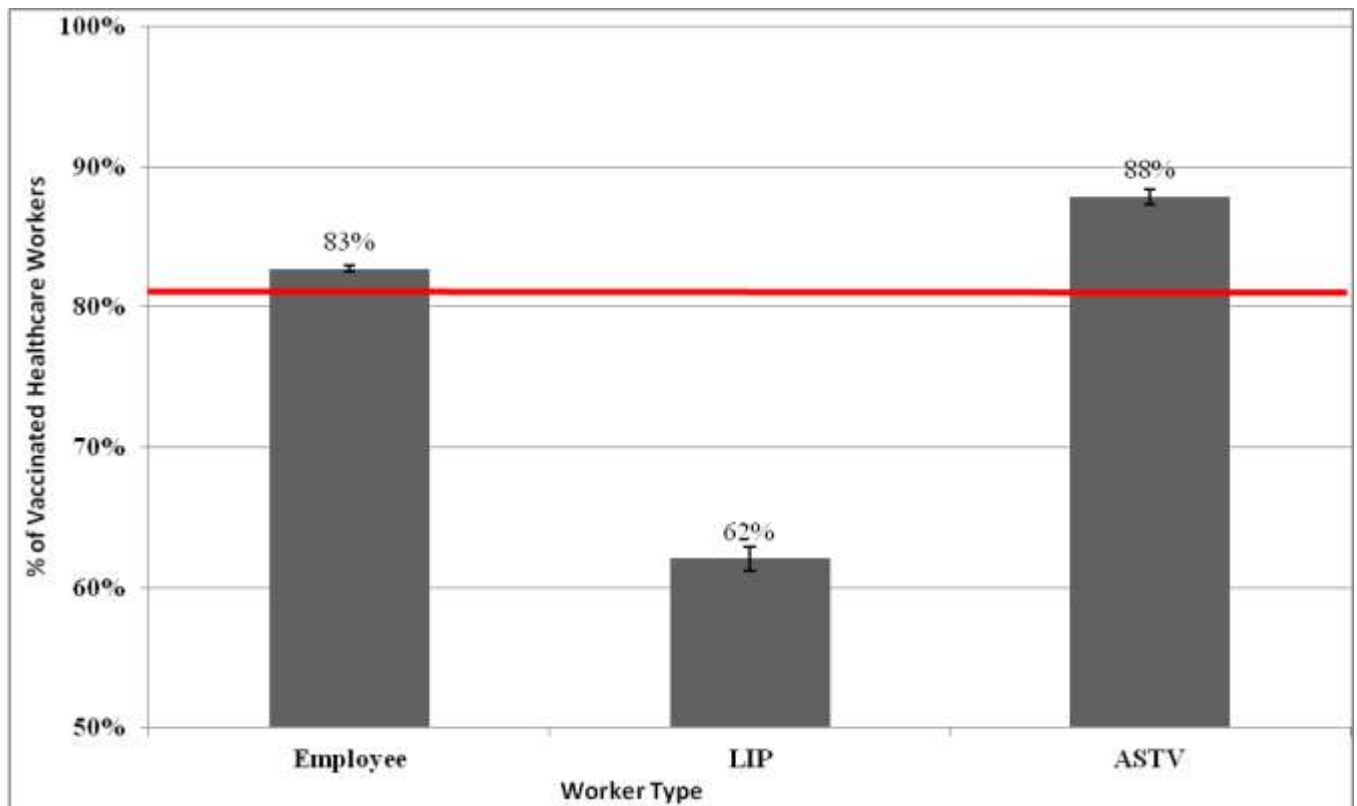

Facility Type	Workers Vaccinated	Total Workers	95% Confidence Interval	% Vaccinated
Acute Care	82638	102052	80.7%, 81.2%	80.9%
LTAC/IRF	1748	2263	75.5%, 78.9%	77.2%
STATE (All Facility Types)	84386	104315	80.7%, 81.1%	80.9%

\*All HCWs = (Employees + LIPs + ASTVs)

Figure 1 shows statewide influenza vaccination percentages for HCWs by worker type. Worker type is stratified into the three categories described in the above methods; 1) Employee, 2) LIP, and 3) Adult trainees/volunteers. Employee and ASTVs worker types had statistically higher

vaccination rate than the statewide vaccination percentage, as 83% and 88%, respectively. The vaccination percentage of LIPs was 62% and was statistically lower than the statewide rate.

**Figure 1. Statewide Influenza Vaccination Percentages for HCWs by Worker Type Across All South Carolina Facilities, 2012 – 2013 Influenza Season**

### **Influenza Vaccination Policies for HCWs**

During the 2012-2013 influenza season, 13 (16%) of 78 reporting facilities required HCW influenza vaccination as a condition of both employment and credentialing, 5 (6%) facilities required vaccination as a condition of employment only, 10 (13%) facilities required vaccination as a condition of credentialing only, and 47 (60%) of facilities did not require vaccination as a condition of employment or credentialing.

Figure 2 displays the influenza vaccination percentages of HCWs for facilities with and without vaccination conditions. HCWs at facilities that reported vaccination as a condition of

employment, credentialing or both employment and credentialing reported vaccination percentages statistically higher than the overall state vaccination percentage. Facilities that required vaccination as a condition of both credentialing and employment reported a vaccination rate of 99%. Facilities that required HCW influenza vaccination as a condition of credentialing had a vaccination rate of 87% and facilities that required healthcare influenza vaccination as a condition of employment had a vaccination rate of 95%. HCWs at facilities where vaccination was not required for either credentialing or employment had a 74% vaccination rate.

**Figure 2. Healthcare Influenza Vaccination Rates by Facility Policy Type, 2012 – 2013 Influenza Season**

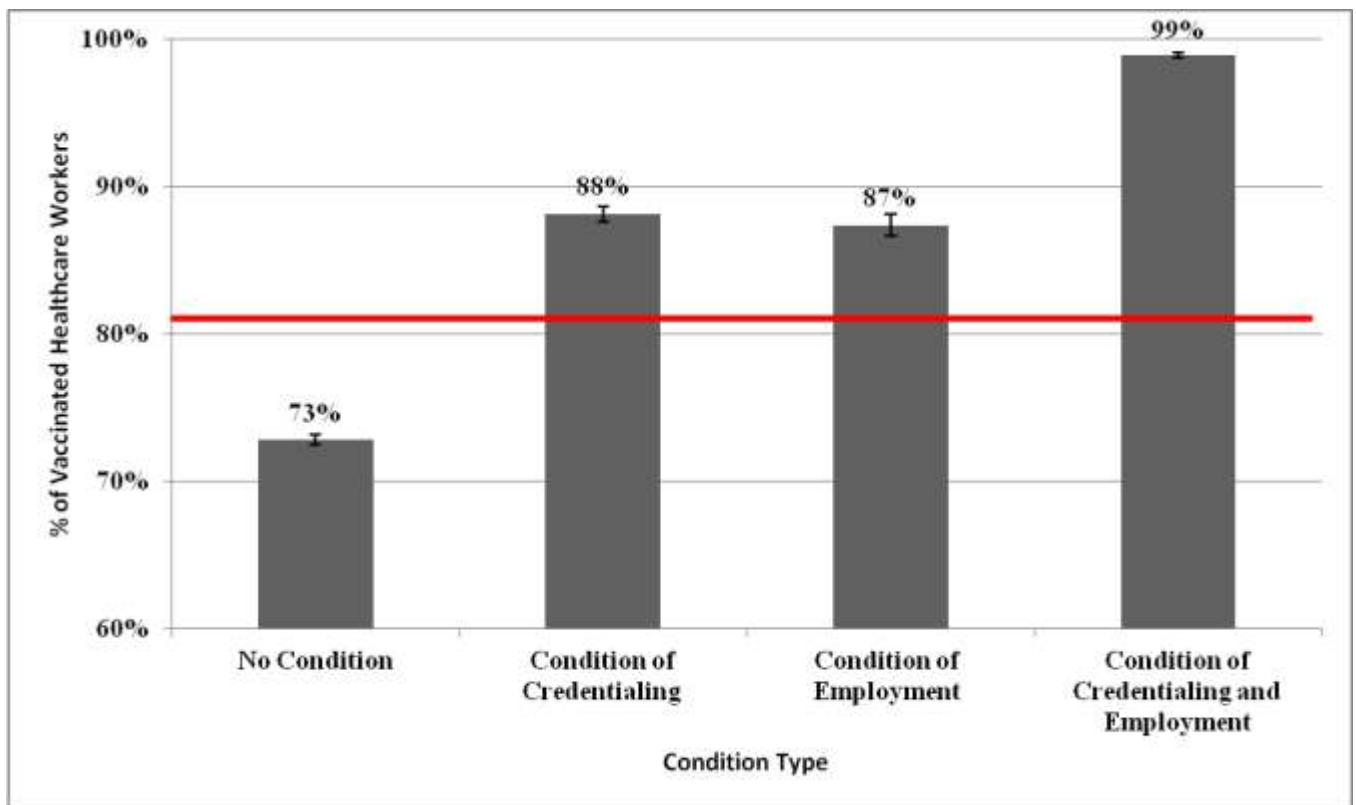

Table 2 shows influenza vaccination percentages for all HCWs at each reporting facility for the 2012-2013 influenza season. Facility vaccination percentages ranged from 38% to 100%. A confidence interval is provided to assess statistical differences in facility HCW influenza

vaccination percentages compared to the statewide HCW influenza vaccination rate. The data presented in Table 2 shows that 8 facilities had HCW influenza vaccination percentages that were similar to the overall State rate, 40 facilities reported HCW influenza vaccination percentages that were significantly higher than the overall State vaccination rate, and 30 facilities reported HCW influenza vaccination rate that were significantly lower than the overall State vaccination rate.

## CONCLUSIONS

This report displays South Carolina HCW influenza vaccination surveillance data by facilities and healthcare worker type for the 2012 – 2013 influenza season. This report provides a picture of HCW influenza vaccination data that can be used by healthcare facilities for improvement in their HCW's influenza vaccination rates, as well as healthcare consumers to make informed decisions regarding HCW influenza vaccination in South Carolina.

Key findings described in this report include the following:

- All 78 HIDA reporting facilities in South Carolina complied with the HAI mandatory reporting requirement to report HCW influenza vaccination summary data for the 2012 – 2013 influenza season. All data was submitted to the Healthcare Personnel Vaccination Module within the NHSN Healthcare Personnel Safety Component.
- Vaccination rates for all HCW types by facility during the 2012 – 2013 influenza season ranged from 38% to 100%. The overall State influenza vaccination rate for all HCW types was 81%. Acute care facilities had an 81% influenza vaccination rate while long term acute care/inpatient rehabilitation facilities had a 77% influenza vaccination rate.
- Employee and ASTV HCW types had vaccination rates of 83% and 88%, respectively. These rates were significantly higher than the Statewide vaccination rate of 81%. LIP HCWs had a 62% vaccination rate which was statistically lower the statewide rate. It is important to note that LIP influenza vaccinations may be underreported due to barriers in capturing LIP influenza vaccination data by facility employee health departments.
- Twenty-eight South Carolina facilities had conditional influenza vaccination policies for healthcare personnel during the 2012-2013 influenza season; 13 (16%) of 78 reporting facilities required HCW influenza vaccination as a condition of both employment and

credentialing, 5 (6%) facilities required vaccination as a condition of employment only, 10 (13%) facilities required vaccination as a condition of credentialing only. Forty-seven (60%) of facilities did not require vaccination as a condition of employment or credentialing. Facilities with conditional influenza vaccination policies had higher vaccination percentages for all HCW types compared to facilities that did not have conditional influenza vaccination policies.

### **ADDITIONAL INFORMATION**

The Appendix contains additional information for each facility. Included are HCW influenza vaccination data by personnel type and facility self reported influenza program information.
