To reduce the lung cancer risk from radon, EPA recommends that all homes be tested, and that homeowners consider mitigation when the average of two radon tests is 4.0 picocuries per liter (pCi/L) or higher. (Radon levels below 4.0 pCi/L still carry some risk.) The results below were compiled from tests done by homeowners, using test kits provided by the S.C. Department of Health and Environmental Control (DHEC), and represent initial tests for homes not been previously mitigated for radon through June 30, 2022. DHEC cannot guarantee that the kits were used under appropriate testing conditions or that the information is without error.
