Post-Natural Disaster Engineer RFP

Background

Following a storm event that impacts coastal South Carolina, the Department of Health and Environmental Control's Office of Ocean and Coastal Resource Management (Department) is responsible for conducting initial damage assessments to evaluate the condition and determine any damage to habitable structures, pools, and erosion control structures (seawalls, bulkheads, and rock revetments) within the State's beachfront jurisdiction. This Request for Proposals (RFP) focuses on professional engineering assessments of pools and erosion control structures after initial damage assessments have been conducted by the Department.

Procedures for determining whether a structure is destroyed beyond repair (DBR) are outlined in South Carolina Coastal Division Regulations.[1] A pool is deemed DBR if more than sixty-six and two-thirds percent of the replacement value of the structure has been destroyed.[2] Erosion control structures destroyed more than fifty percent above grade are deemed DBR.[3, 4]

Per Coastal Division Regulations,[5] pools determined to be possibly destroyed beyond repair will be evaluated by an engineer under contract to the Department. The Department-contracted engineer will make arrangements with the owner of the property to visit the site and prepare an estimate of the cost of repairing the structure to its previously existing condition. In the case of pools, the damage estimate will be determined by the sum of the following costs:

1. The area of damaged walls and floor, multiplied by the unit of the replacement costs for the walls and floor;
2. Demolition and removal costs;
3. Site preparation costs.

The estimate will be based on the amount of damage to various components of the structure, and the unit cost of repairing each component as supplied by a nationally recognized estimating firm.

Erosion control structures determined to be possibly destroyed beyond repair will be further evaluated by an engineer under contract to the Department. For rock revetments, the determination of the degree of destruction must be made on a lot by lot basis by reference to county tax maps.[6] Revetments must be judged on the extent of displacement of stone, effort required to return these stones to the pre-storm event configuration of the structure or device, and ability of the revetment to retain backfill material at the time of damage assessment.[7] Specifically, revetment assessments are to include an evaluation of transects based on: a pre- and post-storm comparison of elevation at the original crest and toe stone locations; and a pre- and post-storm comparison of slope, slumping, ability to retain backfill, and stone amount. Pre-storm crest stone and toe stone x,y,z data will be provided by the Department.

---

[1] S.C. Code Ann. Regs. 30-14(D)(3)
[2] R.30-1(D)(17)(b)
[3] R.30-1(D)(17)(c)
[4] R.30-1(D)(17)(d)
[5] R. 30-14(D)(5)(a)(i)
[6] R. 30-14(D)(3)(d)
[7] R. 30-14(D)(3)(d)

For vertical walls (seawalls and bulkheads), the determination of the degree of destruction must be made on a lot by lot basis by reference to county tax maps, unless the structure was constructed prior to Act 634 of 1988 as a single distinct seawall or bulkhead measuring a minimum of one thousand continuous linear feet parallel to the shoreline. The determination of the degree of destruction must be based on the single continuous seawall or bulkhead as a whole for these structures in accordance with Section 48-39-290(B)(2)(b)(iv).[8]

Damage to vertical walls must be judged on the percent of the structure remaining intact at the time of damage assessment. The portion of the structure or device above grade parallel to the shoreline must be evaluated. The length of the structure or device parallel to the shoreline still intact must be compared to the length of the structure or device parallel to the shoreline which has been destroyed. The length of the structure or device parallel to the shoreline determined to be destroyed divided by the total length of the original structure or device parallel to the shoreline yields the percent destroyed. Those portions of the structure or device standing, cracked or broken piles, whalers, and panels must be assessed on an individual basis to ascertain if these components are repairable or if replacement is required.[9] Pre-storm lengths (x,y,z data) of vertical walls will be provided by the Department.

The following percentages will be used when conducting the destroyed beyond repair assessments for vertical walls: 1) pilings - 20%, 2) whalers - 20%, 3) panels - 60%. On walls with no whalers incorporated into the design, the percentage is to be 25% for the pilings and 75% for the panels. A vertical wall will be considered functional if it is no more than 2 feet out of alignment or 30 degrees, whichever is less. For concrete walls which have only one component, the intact portion above grade, parallel to the shoreline will be compared to the original shore parallel portion of the wall to determine if the structure is damaged beyond repair.[10]

Currently, the Department has an estimated 462 pools within its beachfront jurisdiction, shown by beachfront municipality in Table 1.

Beachfront Municipality	Pools
North Myrtle Beach	122
Arcadian Shores/Briarcliffe Acres	9
Myrtle Beach	70
Surfside	14
Garden City	57
Litchfield Beach	2

Table 2: Erosion control structures by beachfront municipality

Scope of Work

Following a natural disaster, the Department will conduct an initial damage assessment of pools and erosion control structures within the State's beachfront jurisdiction. If the Department's preliminary survey determines the pool or erosion control structure to be possibly destroyed beyond repair, the Department will request that the engineer conduct an assessment to evaluate damage to the structure(s) in question.

Pools

The Department will provide the contractor with an Excel spreadsheet including a list of pools requiring engineering assessment. The spreadsheet will include an Instructions tab and a Pools tab. The Pools tab will be pre-populated by the Department with the following information for each pool requiring assessment: TMS/PIN number, property address, and property owner's name and contact information (if available). The spreadsheet will also include the following empty columns, which will be completed by the engineer (see Deliverables below):

1. Area of damaged walls and floor, multiplied by the unit replacement costs for the walls and floor
2. Demolition and removal costs
3. Site preparation costs
4. Estimated cost of repairing the structure to its previously existing condition (Damage Estimate) - determined by the sum of the following costs: 1.) The area of damaged walls and floor, multiplied by the unit replacement costs for the walls and floor; 2.) Demolition and removal costs; 3.) Site preparation costs. This estimate will be based on the amount of damage to various components of the structure, and the unit cost of repairing each component as supplied by a nationally recognized estimating firm.[11]
5. Base Value - can be obtained from any of the following sources: 1) Bills and invoices submitted to the pool owner at the time of pool installation; 2) tax assessment figures; 3) estimate based on the size of the pool and the unit cost of pool construction as supplied by a nationally recognized estimating firm; 4) any other information that is determined to be reliable by the Damage Assessment Coordinator.[12]
6. Total Percent Damage - Repair estimates should be compared with the base value figures to arrive at the total percent damage (This calculation is the Cost of Repairing the Structure/Base Value of the Structure * 100).

The Department will also provide, as available, historic site photos and post-event flight images.

Erosion Control Structures

For seawalls and bulkheads, the contractor will utilize the Department's *Beachfront Vertical Erosion Control Structure Data Collection Form* when conducting assessments and incorporate this information into the Deliverables for Damage Assessment of Erosion Control Structures (see Deliverables below). A sample copy of the form, and assessment instructions, are included in Appendix A.

For rock revetments, the contractor will utilize the Department's *Beachfront Rock Revetment Data Summary Form* when conducting assessments and incorporate this information into the Deliverables for Damage Assessment of

[11] R.30-14(D)(5)(a)(i)
[12] R.30-14(D)(5)(a)(ii)

Erosion Control Structures (see Deliverables below). A sample copy of the form, and assessment instructions, are included in Appendix B.

The Department will provide the engineer with an Excel spreadsheet, which will include an Instructions tab. The spreadsheet will also include separate tabs for Single Component Vertical Walls, Multi Component Vertical Walls, and Revetments that require an engineering assessment. These tabs will be pre-populated by the Department with the following information for each erosion control structure requiring assessment: TMS/PIN number, property address, and property owner's name (if available). The Multi Component Vertical Walls tab will also note if the Department has assessed the wall as being constructed with whalers or without whalers. Each tab will identify if survey data is available for each structure (Survey Data Available = Y / N).

The Single Component Vertical Wall tab will also include the following empty columns, which will be completed by the engineer (see Deliverables below):

- Percentage of Vertical Wall Totally Destroyed - based on the assessment of damage to the structure as indicated by the contractor on the Department's *Beachfront Vertical Erosion Control Structure Data Collection Form*. The length of the structure or device parallel to the shoreline determined to be destroyed divided by the total length of the original structure or device parallel to the shoreline yields the percent destroyed.
- Percentage of Vertical Wall Remaining Intact - represents the percentage of the single component wall determined by the contractor to be intact (not totally destroyed).

The Multi Component Vertical Wall tab will also include the following empty columns, which will be completed by the engineer (see Deliverables below):

- Percentage of Vertical Wall Totally Destroyed - based on the assessment of damage to the structure as indicated by the contractor on the Department's *Beachfront Vertical Erosion Control Structure Data Collection Form* and should incorporate: 1.) the percentage of the wall determined to be totally destroyed (i.e., all components are cracked, broken, or missing) and 2.) the assessment of damage on the *remaining* portion of the wall (that is not completely destroyed). The following percentages will be used when conducting assessment of damage on the *remaining* portion of the wall that is not completely destroyed: 1) pilings - 20%, 2) whalers - 20%, 3) panels - 60%. On walls with no whalers incorporated into the design, the percentage is to be 25% for the pilings and 75% for the panels.
- Percentage of Vertical Wall Remaining Intact - represents the percentage of the multi component wall determined by the contractor to be intact (not totally destroyed).

If a structure has been listed by the Department as a single component wall and the contractor believes the wall should be assessed as a multi component wall, or vice versa, the contractor should contact the Department's Damage Assessment Coordinator to discuss further.

The Revetment tab will have an empty column for the Percentage of Revetment Totally Destroyed, which will be completed by the engineer (see Deliverables below). This value is based on the assessment of damage to the structure as indicated by the contractor on the Department's *Beachfront Rock Revetment Data Summary Form*.

The Department will also provide, as available, survey data, historic site photos and post-event flight images.

Contractor's Standards of Responsibility

1.) At the time of the proposal and upon award of any tasking, the contractor must provide copies of any and all licenses, proof of insurance, permits, certifications, other relevant third-party experience, and/or other authorizations necessary to carry out the contracted project.

2.) The contractor will respond via phone or email to a request from the Department for damage assessment of designated structures no later than 24 hours after receipt of the Department's request for assistance.

3.) In the case of pools, the Department will provide the contractor contact information for the owner of the property, if available. The contractor will then make arrangements directly with the owner of the property to visit the site.

4.) The contractor will conduct site inspections as quickly as possible and submit deliverables within five (5) business days of completing the assessment. All assessment information must be routed first, and directly through the Department.

5.) On an as needed basis, the contractor will assist the Department in presenting and defending the conclusions of investigations conducted under this contract during meetings with property owner(s), agents and other involved parties; in administrative appeals and during any subsequent litigation.

6.) The contractor shall be required to submit copies of all invoices with adequate documentation for all requested reimbursement of expenditures. Travel expenses (e.g., mileage, food, lodging, etc.) will not be reimbursed under this agreement.

Deliverables for Damage Assessment of Pools

1.) Final Report: The contractor will submit a report to the Department for each structure evaluated. The report should be submitted within five business days of completing the assessment. The report should include the following information:
   a. Tax Map Number of Property
   b. Owner Name
   c. Address
   d. Description of Damage to the Structure
   e. Photographs of the Structure, including any significant damage
   f. Estimated Cost of Repairing the Structure to Previous Condition (Damage Estimate)
   g. Base Value of Pool Structure
   h. Total percent damage calculation

2.) Photographs: Photographs should be provided as individual JPEG images and must be labeled with the full address and the date (e.g. 3000 Marshall Blvd._mmddyyyy).

3.) Pool Excel Spreadsheet: This spreadsheet will be provided by the Department (see Scope of Work above). Columns to be completed by the contractor are identified below and on the Instructions tab in the spreadsheet.
   a. The area of damaged walls and floor, multiplied by the unit replacement costs for the walls and floor;
   b. Demolition and removal costs;

c. Site preparation costs;
d. Estimated cost of repairing the structure to its previously existing condition (Damage Estimate);
e. Base value of the structure; and
f. Total percent damage calculation

Deliverables for Damage Assessment of Erosion Control Structures

1.) Final Report: The contractor will submit a report to the Department for each structure evaluated. The report should be submitted within five (5) business days of completing the assessment. The report should include the following information:
   a. Tax Map Number of Property
   b. Address
   c. Site Description
   d. Observed Deficiencies
   e. Inspection Photographs
   f. Assessment Conclusions (including percentage of structure deemed totally destroyed)
   g. Completed *Beachfront Vertical Erosion Control Structure Data Collection Forms*
   h. Completed *Beachfront Rock Revetment Data Summary Forms*

2.) Inspection Photographs: Photographic documentation of each structure is required. Photographs should be provided as individual JPEG images and must be labeled with the full address and the date of assessment (e.g. 3000 Marshall Blvd._mmddyyyy).

3.) Erosion Control Structure Excel Spreadsheet: This spreadsheet will be provided by the Department (see Scope of Work above). Columns to be completed by the contractor are identified (by tab) below and on the Instructions tab in the spreadsheet.
   a. Single Component Vertical Walls
      i. Percentage of Vertical Wall Totally Destroyed
      ii. Percentage of Vertical Wall Remaining Intact
   b. Multi Component Vertical Walls
      i. Percentage of Vertical Wall Totally Destroyed
      ii. Percentage of Vertical Wall Remaining Intact
   c. Revetments
      i. Percentage of Revetment Totally Destroyed

4.) For multi component walls only, please show all calculations used to arrive at the Percentage of the Vertical Wall Totally Destroyed value.

5.) For revetments only, please also provide:
   a. Excel Spreadsheet with the following information for each transect.
      i. Pre-storm height
      ii. Pre-storm width
      iii. Pre-storm slope
      iv. Post-storm height
      v. Post-storm width
      vi. Post-storm slope
   b. Raw post-storm data collection (x, y, z data for original crest and toe stone locations and substrate characterization) in GIS format.

Relevant Definitions

Erosion control structures (ECS):

1. Seawall: a special type of vertical retaining wall that is designed specifically to withstand normal wave forces;

2. Bulkhead: a vertical retaining wall designed to retain fill material but not to withstand wave forces on an exposed shoreline;

3. Revetment: a sloping structure built along an escarpment or in front of a bulkhead to protect the shoreline or bulkhead from erosion.

Panel: Vertical board or sheet of metal, which is part of a bulkhead or seawall that is held in place by whaler(s).

Pile: Cylindrical or flat member of wood or steel hammered vertically into sand to form part of a foundation for a bulkhead or seawall.

Stone Amount: Amount of stone in a revetment transect, which is recorded as (A) for adequate, (D) for deficient or (S) for surplus.

Whaler: Horizontal member of wood or steel of a bulkhead or seawall, which is attached to piles to hold panels in place between piles.

Appendix A: Vertical Erosion Control Structure Assessment Instructions

Complete the *Beachfront Vertical ECS Data Collection Form*, per instructions. Instructions and a sample form are included on the following pages. *For component definitions, refer to Relevant Definitions above.*

South Carolina Department of Health and Environmental Control
Office of Ocean and Coastal Resource Management

Beachfront Vertical Erosion Control Structure Data Collection Form

South Carolina Coastal Division Regulations

Per South Carolina Code of Regulations, damage to seawalls and bulkheads will be judged on the percent of the structure remaining intact at the time of damage assessment. The portion of the structure or device above grade parallel to the shoreline must be evaluated. The length of the structure or device parallel to the shoreline still intact must be compared to the length of the structure or device parallel to the shoreline which has been destroyed. The length of the structure or device parallel to the shoreline determined to be destroyed divided by the total length of the original structure or device parallel to the shoreline yields the percent destroyed. Those portions of the structure or device standing, cracked or broken piles, whalers, and panels must be assessed on an individual basis to ascertain if these components are repairable or if replacement is required (R.30-14(D)(3)(c)(i)).

Instructions for Completing Beachfront Vertical ECS Data Collection Form

Fill out the Date, Time, Address, and TMS/PIN fields at the top of the form.

Evaluate all visible materials the structure is composed of and circle all that apply.

Determine whether the structure is composed of a single component or multiple components, then evaluate the structure using the appropriate Single Component Wall or Multi-Component Wall sections. *Components include piles, whalers, and panels. Components may be made up of one or more than one material.*

A. Single Component Walls:
   1. Using the ECS survey data provided by DHEC OCRM, identify the "Length_FT" of the structure in the attribute table and enter this value as the ***original length*** in decimal feet (e.g. 100.5 feet; not 100 feet, 6 inches). *For structures with no survey data, measure the wall length within the extent of the parcel boundary (refer to past photos and evidence in the field to guide this measurement).*
   2. Evaluating the above-grade portion of the wall, measure the present length of the structure that is totally destroyed (i.e. the section of the wall where all components are cracked, broken, or missing) and enter length as ***present length totally destroyed*** in decimal feet. All lengths are shore-parallel, wing walls are not included.

B. Multi-Component Walls: Circle all visible components (piles, whalers, panels).
   1. Follow steps 1 and 2 above for Single Component Walls.
   2. For the remaining portion of the wall that is not totally destroyed, count and/or calculate/estimate the number of original components and the number of cracked, broken, or missing components (for each component type). Enter these numbers in the respective fields. If a component crosses a property boundary, determine which property includes the greatest portion or length of the component and count the component toward that property.

South Carolina Department of Health and Environmental Control
Office of Ocean and Coastal Resource Management

Beachfront Vertical Erosion Control Structure Data Collection Form

Damage assessment includes above-grade portion of the structure. All length measurements are shore parallel (wing walls are not included) and must be entered in decimal feet (e.g. 100.5 feet, not 100 feet 6 inches).

Date _____ Time _____

Address _____ TMS/PIN _____

Material(s) *(circle all materials that apply)* *Concrete* *Wood* *Metal* *Vinyl*

Single Component Wall:

Original Length* _____

Present Length Totally Destroyed** _____

Multi-Component Wall:

Original Length* _____

Present Length Totally Destroyed** _____

Components *(circle all components that apply)*

On the remaining portion of the wall, evaluate the following:***

Pilings	# of Original Pilings _____	# of Pilings Cracked/Broken/Missing _____
Whalers	# of Original Whalers _____	# of Whalers Cracked/Broken/Missing _____
Panels	# of Original Panels _____	# of Panels Cracked/Broken/Missing _____

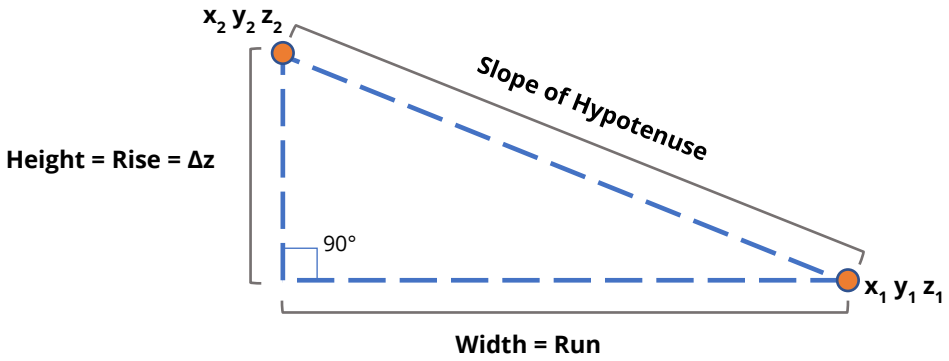
***Original Length:** For known structures, this can be found in the GIS data provided by DHEC OCRM (refer to Length_FT attribute). For suspected ECS, survey data will not be available. In these cases, measure the wall length within the extent of the parcel boundary (refer to past photos and evidence in the field to guide this measurement).*

*** **Present Length Totally Destroyed:** Portion of the structure that is completely destroyed (i.e. all components are cracked, broken, or missing). To be considered functional, a wall must be no more than 2 feet or 30 degrees out of alignment, whichever is less.*

**** **Remaining portion of the wall:** The portion of the wall that is not totally destroyed*

Appendix B: Rock Revetment Assessment Instructions

Pre-Storm Data Calculations: Using data provided by OCRM, calculate pre-storm dimensions of each revetment transect, as outlined below. *In the following schematic, the triangle represents a vertical cross section of the revetment at a transect. The orange points, $x_2\ y_2\ z_2$ and $x_1\ y_1\ z_1$ represent x, y, z coordinates at the crest stone and toe stone, respectively.*



- Calculate the change in ***height*** between the crest and toe stone (i.e. rise) at each transect. The height (Δz) should be calculated in decimal feet as follows.

$$Height = \Delta z = z_2 - z_1$$

- Determine the ***width*** (i.e. run) at each transect. The width should be calculated in decimal feet as the distance between coordinates $x_2\ y_2$ and $x_1\ y_1$.[13] Please identify the methodology that will be used to calculate this distance.
- Calculate the ***slope*** of the line between the crest stone and toe stone points (i.e. slope of the hypotenuse) at each transect. The slope should be calculated as rise over run (i.e. height divided by width).

$$Slope = \frac{Height}{Width}$$

Post-Storm Data Collection: At each transect, check into pre-storm x, y locations of the crest stone and toe stone, and capture new post-storm x, y, z coordinates at the original crest stone and original toe stone locations, noting (using codes) whether the substrate at each location is rock, sand, or other.

Post-Storm Data Calculation: Calculate post-storm dimensions at each transect that correspond to pre-storm dimensions, using the same instructions above (i.e. height, width, slope).

Pre-Storm/Post-Storm Comparison Calculations: Using pre- and post-storm dimensions, calculate:

- Change in elevation at original crest stone x, y location at each transect in decimal feet.

$$Change\ in\ Elevation_{Crest} = z_{2_{post-storm}} - z_{2_{pre-storm}}$$

- Percent change in elevation at original crest stone location at each transect.

[13] A variety of tools may be used to calculate the distance between coordinate sets, for example an online calculator may be used (e.g. https://gps-coordinates.org/distance-between-coordinates.php).

$$Percent\ Change\ in\ Elevation_{Crest} = \frac{z_{2_{post-storm}} - z_{2_{pre-storm}}}{z_{2_{pre-storm}}} \times 100$$

- Change in elevation at original toe stone x, y location at each transect in decimal feet.

$$Change\ in\ Elevation_{Toe} = z_{1_{post-storm}} - z_{1_{pre-storm}}$$

- Percent change in elevation at original toe stone location at each transect.

$$Percent\ Change\ in\ Elevation_{Toe} = \frac{z_{1_{post-storm}} - z_{1_{pre-storm}}}{z_{1_{pre-storm}}} \times 100$$

- Change in slope at each transect.

$$Change\ in\ Slope = Slope_{post-storm} - Slope_{pre-storm}$$

- Percent change in slope at each transect.

$$Percent\ Change\ in\ Slope = \frac{Slope_{post-storm} - Slope_{pre-storm}}{Slope_{pre-storm}} \times 100$$

Complete the *Beachfront Rock Revetment Data Summary Form* per instructions. Instructions and a sample form are included on the following pages.

South Carolina Department of Health and Environmental Control
Office of Ocean and Coastal Resource Management

Beachfront Rock Revetment Data Summary Form

South Carolina Coastal Division Regulations

Per South Carolina Code of Regulations, rock revetments must be judged on the extent of displacement of the stone, effort to return this stone to the pre-storm event configuration of the structure or device, and the ability of the revetment to retain backfill material at the time of the damage assessment (R.30-14(D)(3)(d)).

An inventory of a revetment will require that the seaward slope of the structure be determined by pulling at tape from the highest crest stone to the top of a representative toe stone. Revetment transects will begin at the northern property line and are to be repeated every 20 feet across the revetment to the southern property line. The frequency of these transects may be intensified to every 10 feet to encompass high or low extremes in the rock elevations. A schematic drawing shall depict the revetment by its transects. Beside each transect shall appear the letters (A) for adequate stone amounts, (D) for deficient stone amounts, and (S) for surplus stone amounts. Combinations of these letters on one transect will be separated by a short line that will distinguish one depiction from the other along the transect. The elevation at the top of the revetment must also be included (R.30-14(D)(4)(b)).

To determine if a revetment is destroyed beyond repair, revetment transects must be conducted as described in the inventory section, R.30-14(D)(4). The post-damage assessment transects will be compared to the original revetment configuration. If the revetment has slumped or stone been lost to the extent that the percentage of damaged revetment exceeds the percentages allowed in R.30-14(N)(3)(e), the structure is destroyed beyond repair (R.30-14(D)(5)(b)(ii)).

Instructions for Completing Rock Revetment Data Summary Form

Fill out the date, time, address, and TMS/PIN section.

Identify if the structure is a combination of a vertical wall fronted by a rock revetment.

Transect Assessment Table: For each transect, fill out the table with the following information.

- Enter calculated value of change in elevation at original crest stone x, y location in decimal feet.
- Enter calculated value of % change in elevation at original crest stone x, y location.
- Enter calculated value of change in elevation at original toe stone x, y location in decimal feet.
- Enter calculated value of % change in elevation at original toe stone x, y location.
- Enter calculated value of change in slope.
- Enter calculated value of % change in slope.
- Determine if the revetment has slumped at each transect. (Y or N).
- Determine if the revetment has the ability to retain backfill at each transect. (Y or N).
- Characterize the stone amount at each transect as S (surplus), A (adequate), or D (deficient).

Based on the assessment information above, and your professional expertise, enter the percentage of the revetment that is totally destroyed.
