### **SUMMARY OF CHANGES FOR 2020**

The ambient groundwater monitoring activities remain suspended.

### 1.0 PROJECT MANAGEMENT

### 1.1 Introduction/Background

This monitoring strategy establishes the overall goals and objectives for those key elements of the South Carolina Department of Health and Environmental Control (SCDHEC) water quality monitoring program to achieve the goals of the South Carolina Pollution Control Act (PCA), the federal Clean Water Act (CWA), and implement applicable State and Federal regulations. Under the PCA and CWA, SCDHEC has been delegated certain water quality monitoring responsibilities. These include water quality assessment, regulatory monitoring, and program evaluation as needed to fulfill the requirements of the aforementioned Acts. This strategy also serves to document these monitoring activities within the framework presented in the EPA guidance Elements of a State Water Monitoring and Assessment Program (USEPA, 2003). This monitoring strategy document, in conjunction with the referenced field and laboratory Standard Operating Procedures (SOPs), also serves as the Quality Assurance Project Plan for the ambient surface water quality monitoring program.

State administrators need to assess the quality of the aquatic environment so that they can make decisions concerning water program priorities and provide reports to the public on the state of the environment, important trends over time, and accomplishments. They also need to evaluate the effectiveness of control measures. Water quality monitoring data provide information necessary to meet these needs. While there are different approaches and philosophies of water quality monitoring, monitoring is not an end in itself but is only a catalyst to spur decisions regarding achievable and desirable resource use alternatives. Monitoring alone does not achieve protection and restoration of water quality. Monitoring data serves as a tool to assess conditions, to suggest where corrective actions may be necessary, and evaluate the results of those actions. Monitoring data serves as the foundation for informing the Department's water quality decision-making responsibilities.

"Ambient monitoring" refers to monitoring of general surroundings, and includes the set of activities that provide chemical, physical, geological, and biological data about general conditions in the environment. For the purpose of this strategy, water quality monitoring is limited to those activities involved in the State implementation of the PCA and CWA in inland and coastal waters. "Regulatory monitoring" is the collection and analysis of data needed for establishing environmental quality-based permit requirements and for assessing and enforcing compliance with permits. "Regulatory monitoring" also provides data necessary for addressing environmental quality-based assessments of ambient water related to point source and nonpoint source influences.

In general, the water quality monitoring activities need to answer key questions about the overall quality of waters in South Carolina, changes in water quality over time, where there are problem areas and areas needing additional protection, the level of protection needed, and the effectiveness of specific clean water projects and programs. However, monitoring is actually a multifaceted discipline with many program areas conducting monitoring activities to fulfill specific objectives: fish tissue monitoring to develop, track, and update fish consumption advisories; ocean monitoring to issue timely beach swimming advisories; shellfish sanitation monitoring to determine the

harvesting status of the numerous shellfish beds in the state; macroinvertebrate monitoring to determine the health of biological communities of specific waterbodies; ambient surface water monitoring to assess compliance with water quality standards and examine long-term trends at a variety of scales; ambient groundwater monitoring to assess water quality across the major aquifers of the state (currently suspended); National Pollutant Discharge Elimination System (NPDES) discharge monitoring to ensure facilities are in compliance with their permit limits; and special studies for more intensive investigation of specific issues.

Therefore it is necessary to use these varied monitoring activities as the vehicle for a cohesive, interrelated approach to water quality management via these diverse types of data. It is through the monitoring programs that sample acquisition, data management and reporting, program needs, committed tasks, and other such Departmental functions all meet. Thus, it is at this natural point of confluence that much opportunity is afforded for integration of sometimes apparently non-related tasks or programs into a step-wise, interrelated approach to the protection of water quality in the State. A great deal of attention to each of those "facets" is required in order for the resulting data to be of the most benefit. As a result, many of the aforementioned programs collect additional samples as part of their activities for the analysis of constituents beyond those required to fulfill their specific objectives. For example, beyond the parameters that can be directly compared to numeric state water quality standards, the Ambient Surface Water Physical & Chemical Monitoring program collects information on additional parameters that are used by the NPDES permit writers and the 303(d), Modeling and TMDL Section to define background conditions and to establish limits for what can safely be discharged by a wastewater treatment facility.

### 1.2 Monitoring Objectives

The information resulting from these monitoring activities are integrated and considered together in various decision-making processes. The incorporation of various data sources allows the Department to address broader objectives. Specific objectives of SCDHEC's water quality monitoring strategy include:

### 1.2.1 Determining water quality standards attainment

The primary goal is the attainment and maintenance of fishable/swimmable waters wherever possible as mandated by the Clean Water Act (CWA). This includes evaluation of water quality conditions against State Standards, encompassing both numeric and narrative criteria defining designated uses. In evaluating the degree of support of these goals consideration is given to chemical specific data from all components of the Ambient Surface Water Physical & Chemical Monitoring Program, including Chlorophyll Monitoring data, Macroinvertebrate Bioassessment results, the occurrence of fish consumption advisories or shellfish harvesting limitations, and the results of intensive surveys and special water quality studies. The conclusions from such evaluations can range spatially from a much localized stream segment to entire waterbodies, to entire statewide resource condition using the statistical survey monitoring data. The results of such assessments are reported in the *State of South Carolina Integrated Report*, Parts 1 and 2, which addresses related CWA reporting requirements for §303(d), §305(b) and §314. Please refer to the individual program area descriptions that follow for more details and references or links to published documentation. Results from the Ocean Water Monitoring program are used independently in issuing swimming

advisories at coastal beaches.

### 1.2.2 Identifying impaired waters

Through the water quality standards attainment evaluations, waters or portions of waterbodies may be identified that are not attaining all State Standards. When this evaluation is conducted specifically for the biennial development of the State of South Carolina Integrated Report, such waters are determined to be "impaired" and are included in the section listing impaired waters which serves to address §303(d) reporting requirements of the CWA. The most current version of the *State of South Carolina Integrated Report Part I: Listing of Impaired Waters* can be found at <a href="http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/">http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/</a>.

### 1.2.3 Identifying causes and sources of water quality impairments

The process of determining water quality standards attainment and identifying impaired waters establishes a reason for listing a waterbody as impaired. In many cases it is a physical or chemical parameter that is not in compliance with the State Standards, or the cause of nonsupport, and work begins to identify the source from which it originates. In other cases the reason for listing may be more complex, such as alteration to the aquatic macroinvertebrate community, and the specific cause for the alteration may not be immediately apparent. In such instances a specific cause must be identified before a source can be targeted for control. In instances where a cause of impairment or source for the cause is not readily apparent special studies or intensive surveys may be designed to help determine the causes and sources of nonsupport of designated uses. The data typically collected during such surveys can be physical and chemical water quality parameters, hydraulic stream characteristics, biological community sampling, and effluent and compliance sampling.

### 1.2.4 Establishing, reviewing, and revising water quality standards

Data collected by the monitoring activities are used in the development of designated use classifications and water quality standards, which are in turn used to establish waterbody-specific use classifications. Review of these ambient data help determine if existing water quality in a classified water is adequate to protect existing and designated uses and if appropriate standards have been set. Used in such a manner, ambient data provide valuable feedback to the NPDES permit writing sections as an indication of the need for further discharge restrictions.

The ambient data serve to help the refinement of standards and use classifications and, in the absence of numeric criteria, identify and establish appropriate background levels to set standards for additional pollutants. One example was the development of ecoregion specific numeric nutrient and chlorophyll standards for lakes and reservoirs. Ambient data collected statewide as part of the Ambient Surface Water Physical & Chemical Monitoring and Chlorophyll Monitoring programs over a period of many years was used as the basis for identifying ecoregional differences and ranges and were eventually used to set the final numeric standards. A similar process is underway to develop numeric nutrient and chlorophyll standards for estuarine waters. Another example is the recent development of *Escherichia coli* standards for freshwater to replace the existing fecal coliform bacteria standards. Weekly sampling at 74 monitoring sites in a variety of settings across the state formed the basis for the new *E. coli* standards.

### 1.2.5 Supporting the implementation of water management programs

The SCDHEC Bureau of Water focuses its program activities using a Watershed Water Quality Management approach. Watershed water quality management recognizes the interdependence of water quality and all the activities that occur in the associated drainage basin including point source discharges, nonpoint source contributions, and land use characteristics. SCDHEC's Watershed Water Quality Management approach is dependent upon water quality data as the foundation for development of watershed management plans and implementation strategies. These strategies serve to refocus water quality protection efforts including monitoring, assessment, problem identification and prioritization, wasteload allocation monitoring, planning, permitting, and other agency activities.

### 1.2.6 Supporting the evaluation of program effectiveness

By integrating all of the monitoring activities described herein it is possible to identify the sources of pollution and the reasons for nonattainment of designated uses, to address specific issues, determine the efficiency of pollution abatement programs, and allow administrative overview of program effectiveness.

### 1.2.7 Monitoring for Water Quality-Based Controls

The development of discharge controls based on receiving waterbody quality is a very high priority. It involves the collection and analysis of effluent and ambient data to develop water quality-based National Pollutant Discharge Elimination System (NPDES) permit limits. This may involve the calculation of Total Maximum Daily Loads (TMDL) for specific waterbodies and Wasteload Allocations (WLA) for point source discharges.

SCDHEC uses long-term ambient monitoring data and special study data, including intensive survey data, in developing WLAs and TMDLs. The kinds of data collected for this type of monitoring may include physical and chemical characterization of effluent and receiving waters, stream hydraulics, macroinvertebrate and fish community assessment of the receiving stream, periphyton/phytoplankton sampling, and toxicity bioassays of effluents and receiving waters.

The data are used by the 303(d), Modeling, and TMDL Section in predictive mathematical models to help determine waste treatment levels needed to maintain instream standards. The modeling results are then passed to engineers in the Water Facilities Permitting, and Dams Safety and Stormwater, Permitting, and Monitoring, Assessment and Protection Divisions to be used as the basis for setting final NPDES permit limits. The ambient monitoring data are also used directly by the engineers the Water Facilities Permitting, and Dams Safety and Stormwater Permitting, Divisions to establish background conditions for conservative and/or toxic pollutant NPDES permit limits.

### 1.2.8 Monitoring for NPDES Permit Compliance and Enforcement

The NPDES permit is the principal regulatory tool for controlling the quantity of pollutants discharged to the State's waters and for obtaining data on point-source discharges. Data supplied by the discharger in the form of routine Discharge Monitoring Reports (DMR) and data collected by SCDHEC personnel from Compliance Sampling Inspections (State CSI and Federal Compliance

Sampling Inspection), Federal Compliance Evaluation Inspections (CEI), State Operation and Maintenance Inspections (O&M), Performance Audit Inspections (PAI), Technical Assistance Evaluations (TAE), and Pretreatment Program Audit and Inspections are reviewed by the Water Pollution Compliance and Water Pollution Enforcement Sections to determine the compliance status of a discharger.

In all instances of effluent noncompliance, enforcement actions are supported by all of the above data supplied by the Water Pollution Compliance and Water Pollution Enforcement Sections and all ambient monitoring, special studies, and biological monitoring data supplied by the Aquatic Science Programs. The Bureau of Environmental Health Services personnel conduct the majority of the routine inspections and physicochemical ambient monitoring activities. Data secured and supplied by these monitoring activities are utilized in the majority of SCDHEC's Environmental Affairs enforcement activities.

### 1.2.9 Making Data Readily Available

The last major consideration that has been given to developing a successful monitoring program by South Carolina is the identification of the users of data or the sources of data requests. In South Carolina, this group is quite diverse ranging from individual citizens to interested public groups to various local/state/federal agencies. Data users are:

- Departmental program areas (e.g., domestic wastewater engineers)
- Water quality trend/ambient condition analysts
- Wasteload allocation analysts
- Public/private environmental groups
- Public at large
- Other local/state/federal agencies (regulatory & non-regulatory)
- Departmental administrators via program area outputs

While this large group utilizes the data for different reasons, the Department uses and applies the data to the intermediate objectives and goals as previously discussed. This is done to ascertain whether progress is being made toward successful achievement of these goals and to make correct and appropriate decisions regarding maintenance and enhancement of desirable environmental quality in the State.

Implicit in the identification of users of the data, whether in-Department or out-of-Department, is the capacity to communicate the data to interested parties efficiently and accurately. The SC Watershed Atlas (<a href="https://gis.dhec.sc.gov/watersheds/">https://gis.dhec.sc.gov/watersheds/</a>) presents summary information from a large variety of Bureau of Water programs on a state map format, with links to many reports and detailed information on the different map features. Technical reports or internal memoranda are produced for every special study and copies are available to any interested organization or persons. A list of technical reports is available upon request. The reports required under CWA §303(d) and §305(b) are available on the SCDHEC website, <a href="http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/">http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/</a>. Raw data from the Ambient Surface Water Physical & Chemical Monitoring, Ocean Water Monitoring, and Groundwater Monitoring activities are available online in the National Water Quality Monitoring

Council's Water Quality Portal water quality database at <a href="https://www.waterqualitydata.us/">https://www.waterqualitydata.us/</a>. Special studies and biological data are available in several formats through the Aquatic Science Programs. Specific data storage guidelines are addressed in the data management section of each type of monitoring design.

Thus, water quality assessment is a broad term describing a multitude of monitoring and sampling activities. Water quality assessment data can be used to fulfill a variety of goals; assessment of current conditions, assessment of long-term trends, determination of priority waterbodies, determination of waterbody designated use attainment or nonsupport, and identification of continuing or emerging problem areas.

By integrating all of these monitoring programs it is possible to identify the sources of pollution and the reasons for nonattainment of designated uses, to address specific issues, determine the efficiency of pollution abatement programs, and allow administrative overview of program effectiveness.

### 1.3 Project Organization

To accomplish the objectives of the State of South Carolina Monitoring Strategy several key individuals are identified below with their role and responsibilities.

### 1.3.1 Program Coordinator/Project Manager (Central Office)

The Program Coordinator/Project Manager is responsible for the oversight of the Ambient Water Quality Monitoring Program. This includes insuring consistency between Regional Offices and resolving any discrepancies in the sampling and notification programs. The Program Coordinator is also responsible for the overall data management and reporting to EPA. The Program Coordinator reports directly to management.

### 1.3.2 Manager, Quality Assurance Manager (Central Office)

The Quality Assurance Manager (QAM) is responsible for the oversight of all quality assurance activities associated with the DHEC sampling and analysis SOPs. The QAM will resolve any issues when corrective actions are needed to address data quality issues involving DHEC staff and SOPs. The QAM reports directly to management.

### 1.3.3 Monitoring Program Manager (Central/Regional Offices)

Each Monitoring Program Manager is responsible for local oversight of the ambient water quality monitoring program. Program Managers insure sampling is conducted as outlined in the Monitoring Strategy and report any problems to the Program Coordinator. The Monitoring Program Manager reports directly to management.

### 1.3.4 Laboratory Manager (Central/Regional Offices)

Each Laboratory Manager is responsible for overseeing the operations of the laboratory and assuring compliance with laboratory SOPs and quality control procedures. Laboratory Managers review,

verify, and release lab data from the laboratory. Laboratory Managers report directly to management.

### 1.3.5 Monitoring Personnel (Central/Regional Offices)

Monitoring personnel are responsible for proper sample collection and transport of samples by adhering to applicable SOPs. Monitoring staff report to the Central/Regional Office Program Manager.

### 1.3.6 Project Organizational Chart Ambient Surface Water Quality Monitoring Program

### 1.4 Project/Task Description

### 1.4.1 USEPA Elements of a State Water Monitoring and Assessment Program

CWA Section 106(e)(1) requires the Environmental Protection Agency (EPA) to determine that a State is monitoring the quality of navigable waters, compiling, and analyzing data on water quality and including it in the State's Section §305(b) report prior to the award of Section §106 grant funds. The USEPA Elements of a State Water Monitoring and Assessment Program is meant to serve as the framework for evaluating how state monitoring programs accomplish this task. The individual Elements identified in the EPA document that a state program should address include:

- Monitoring Program Strategy
- Monitoring Objectives
- Monitoring Design
- Core and Supplemental Water Quality Indicators
- Quality Assurance

- Data Management
- Data Analysis/Assessment
- Reporting
- Programmatic Evaluation
- General Support and Infrastructure Planning

It is therefore primarily directed at monitoring activities used to address the determination of designated use support from the viewpoint of §303(d) and §305(b) of the CWA, and specifically to ambient monitoring activities as opposed to compliance related monitoring.

As alluded to above and described in more detail in the following sections of this document, the Department conducts a great deal of additional water monitoring, that while not specifically used for those purposes, is nonetheless critical to carrying out the overall mission of protection and restoration of water quality in the State. Some of the Elements can be broadly applied to all of the Department's ambient monitoring activities, others are more appropriately addressed by the individual program area, and some are applicable at both levels. For example, the Department's overall objectives are general and applicable to multiple program outcomes, but each program may also have very specific objectives for their monitoring activities. The monitoring design may be different programs and some programs may employ more than one monitoring design to accomplish multiple objectives. Therefore each ambient monitoring program area is organized with sections titled by Element and some of these sections may refer to a separate encompassing discussion of specific Elements.

### 1.4.2 Core and Supplemental Water Quality Indicators (Measurements)

Water quality indicators are the means to measure achievement of desired designated uses such as support and maintenance of aquatic life, suitability for recreation, and fish and shellfish consumption.

Core indicators are considered most important for directly assessing water quality standards (WQS) attainment as they relate to the designated uses. The set of core indicators is generally used for initial water quality assessments and are applied consistently over broad scales, e.g. statewide. The core set of indicators usually includes physical, chemical, and biological measures of a waterbody (Table 1).

Supplemental indicators generally do not have specific water quality standards but may help suggest sources that might cause or contribute to nonattainment of designated uses (Table 1). They can be pollutants that lack numeric water quality standards but may be indicative of specific activities such as certain manufacturing processes, agricultural practices, current land-use patterns (i.e. type and amount of development), or historic conditions that are no longer present. See Intensive Surveys and Special Water Quality Studies section for further discussion of selection of supplemental indicators.

Assessment of designated use support often includes the use of data generated by multiple programs. More comprehensive lists of indicators are addressed under individual program descriptions.

### 1.4.3 Data and Field Quality Objectives and Criteria

Program specific requirements for data quality objectives and assessment methodology are included in the "Data Analysis/Assessment" discussions in Sections 2.1 through 2.5. The formal Data Quality Objectives process includes the following steps:

- 1. State the problem
- 2. Identify the decision
- 3. Identify inputs to the decision
- 4. Define the study boundaries
- 5. Develop a decision rule
- 6. Specify tolerable limits on decision error
- 7. Optimize the design

This document serves as an umbrella type Quality Assurance Project Plan that describes the entire ambient monitoring program. While steps 1 and 2 are largely mandated by the USEPA, specific SCDHEC objectives are detailed in section 1.2.

Samples are collected and field measurements conducted by Bureau of Environmental Health Services personnel from the corresponding SCDHEC Regional Laboratory Office following the most current revision of SCDHEC's <u>EA Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, BEHSPROC 200 - Ambient Surface Water Sampling, BEHSPROC 201- Field Temperature Measurement in Surface Water, <u>BEHSPROC 203 - Field pH Measurement in Surface Water, BEHSPROC 203 - Field pH Measurement in Surface Water, BEHSPROC 204 - Field Specific Conductance Measurement in Surface Water, and BEHSPROC 205 - Multi-Parameter Field Measurements in Surface Water, as appropriate.</u></u>

The Bureau of Environmental Health Services, Analytical and Radiological Environmental Services Division laboratories analyze the resulting chemical and microbiological samples. These data provide step 3 – inputs to the decision. Specific performance and measurement criteria are addressed in each field and analytical SOP. Acceptance criteria for reporting results are also stated in each SOP. Detection limits for all analytical measurements may be referenced in Section IV-J of the most current revision of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories. SOP II, Quality Assurance of Analytical Performance A of the lab manual addresses control of analytical performance. Precision, accuracy, data verification, data quality audits, corrective actions, evaluating statistical control, and anomaly determination are covered. SOP II, Quality Assurance/Quality Control Plan of the most current revision of SCDHEC's Laboratory Procedures Manual for Environmental Microbiology, covers similar details for microbiological analyses. The QA Policy and criteria for assessing data quality is discussed in Section 3 of the most current revision of SCDHEC's EA Environmental Investigations Standard Operating Procedures and Quality Assurance Manual and also in the SCDHEC EA Quality Management Plan. Training requirements for field and lab staff and a list of documents and records maintained is discussed in Section 2.7 of this strategy.

Table 1 below gives a general overview of the Core and Supplemental Indicators that may be

routinely collected and analyzed. Greater detail is included in Appendix D.

The study boundary, Step 4, is the entire state of South Carolina. Detailed lists of the monitoring site locations are included in Appendices A, E, F, G, and H.

The Assessment Methodology applied as the decision rule, Step 5, is documented in the most current version of the *State of South Carolina Integrated Report Part I: Listing of Impaired Waters*, updated biennially, available on the SCDHEC website at <a href="http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/">http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/</a>.

Steps 6 and 7 document the consequences of decision error and how to optimize the design to avoid making an erroneous decision. Section 2.1.12 details the consequences of that decision error for ambient chemical and microbiological data, Section 2.3.1.6 addresses macroinvertebrate data, and Section 2.3.2.3 addresses fish tissue data. Optimizing the design from step 7 includes corrective actions to avoid decision error.

### 2.0 AMBIENT WATER QUALITY MONITORING SAMPLING DESIGN

Ambient Water Quality Monitoring activities are carried out as part of several different program areas, each with specific monitoring objectives. In addition to the core data required to accomplish the individual program goals, additional ancillary data are often collected that are necessary to other program areas and broader Environmental Affairs (EA) objectives. Much of the data collected serves multiple purposes, being used by many program areas to address several EA needs. The overall purpose of Ambient Water Quality Monitoring is to provide a system of monitoring activities that produces well defined data reflecting a variety of water quality conditions, physical, chemical, and biological, in the major water resources of South Carolina, including streams, reservoirs, estuaries, and groundwater aquifers.

All sampling procedures and analyses are performed in accordance with the Quality Assurance Manager (QAM). All sample collection procedures follow the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Sections 3, 7, 14, and 19. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology--ARESD.

### 2.1 Ambient Surface Water Physical & Chemical Discrete Monitoring

### 2.1.1 Monitoring Objectives

The purpose of the Ambient Surface Water Physical & Chemical Monitoring Network is to provide a system of monitoring sites that are sampled in a way that produces well defined data reflecting physical and chemical conditions of the streams, reservoirs and estuaries in South Carolina.

### 2.1.2 Monitoring Design

There are currently two major components to Surface Water Physical & Chemical Monitoring, including ongoing fixed-location monitoring and statewide statistical survey monitoring; each designed to provide data for water quality assessment of major water resource types at different spatial and temporal scales.

The fixed-location component of the monitoring network is comprised of Base Sites that are generally sampled once per month, year-round. Statistical Survey Monitoring Sites are typically sampled once per month for one year and moved from year to year. These basic components are discussed in the following sections.

### 2.1.2.1 Base Sites

Base Sites represent the base network of 243 permanent, fixed-location, monitoring sites (Figure 1). Base Sites are sampled monthly, year-round, over an extended period of time, in a uniform

manner to provide solid baseline data. Base Sites were chosen to target the most downstream access (pour point) of each of the National Watershed Boundary Dataset (WBD) 10-digit watershed units (WSU) in the state, as well as the major waterbody types that occur within these WSUs. In some years individual Base Sites may satisfy the requirements of Statistical Survey Monitoring Sites (see Section 2.1.2.3 below) and are sampled monthly as part of that monitoring component or may represent Waters of Concern (see Section 2.1.2.4).

For example, where a WSU ends in a major reservoir, a Base Site is placed in the impounded area to represent reservoir conditions, and another Base Site is generally placed in the main stream feeding that part of the reservoir to represent conditions in the free-flowing portion of the WSU. Similarly, in a primarily riverine WSU ending in estuarine areas at the coast, Base Sites may be placed in both the free-flowing freshwater portion as well as the saltwater area to represent conditions in both habitats. The result is consistent data from all WSUs in the state that can be used in tracking standards compliance and long-term trends.

Samples are collected and field measurements conducted by Bureau of Environmental Health Services personnel from the corresponding SCDHEC Field Laboratory Office following the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Sections 3, 7, 14, and 19. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology-- ARESD. The number of monthly Base Sites per Field Laboratory Office for 2020 is:

Greenville	41	Florence	42
Aiken	29	Columbia	30
Charleston	29	Lancaster	30
Beaufort	29		

In addition, 5 Base Sites are collected by the Santee Cooper Public Service Authority in a cooperative effort.

Base Sites and location descriptions are listed by Field Laboratory Office in Appendix A, and by waterbody name in Appendix B. Parameter coverage, frequency of analysis, and STORET parameter codes are given in Appendices C and D.

### 2.1.2.2 Special Request Sites

Special Request Sites are temporary fixed-location sites that target locations of special interest to the Department related to specific data needs. Examples of site selection criteria for establishment of Special Request Sites includes, but is not restricted to:

- 1. To track the progress of specific remediation activities.
- 2. To gather additional data in specific areas for the development of total Maximum Daily Loads (TMDLs).

- 3. To gather data for Wasteload Allocation modeling needs.
- 4. To obtain data necessary for setting NPDES permit limits.

Special Request Sites are also sampled monthly, year-round, over a finite time period.

Samples are collected and field measurements conducted by Bureau of Environmental Health Services personnel from the corresponding SCDHEC Field Laboratory Office following the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Sections 3, 7, 14, and 19. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology-- ARESD. For 2020 there are 21 Special Request Sites (Figure 1) distributed amongst the Field Laboratory Offices as follows:

Greenville	3	Florence	0
Aiken	0	Columbia	14
Charleston	0	Lancaster	9
Beaufort	0		

Special Request Sites and descriptions are listed by field laboratory in Appendix A, and by water body name in Appendix B. Parameter coverage, sampling frequency, and STORET parameter codes are given in Appendices C and D.

### 2.1.2.3 Statistical Survey Monitoring Sites

Statistical survey monitoring is a design in which the population of interest is sampled in a fashion that allows statements to be made about the whole population based on a subsample and produces an estimate of the accuracy of the assessment results. The advantage of the statistical survey sampling design is that statistically valid statements about water quality can be made about large areas based on a relatively small subsample. Statistical survey water quality data can be used to make inferences, with known confidence, about the condition of the water resources of the State.

A statewide statistical survey, or random sampling, component is part of the Ambient Surface Water Quality Monitoring Network. Separate monitoring schemes have been developed for stream, lake/reservoir, and estuarine resources to represent the entirety of each resource type as described below. Each year a new set of statistical survey sites is selected for each waterbody type. Site selection is done in association with the U.S. Environmental Protection Agency, National Health and Environmental Effects Research Laboratory (NHEERL), Corvallis, Oregon. Although statements about resource conditions can theoretically be made based on data from a single year, the compilation of data from additional years will increase the confidence and accuracy of statements about water quality. An additional advantage of the statistical survey approach is that it presents the opportunity for previously unsampled locations to be selected for data collection.

### Streams

Approximately 30 statistical survey sites will be sampled in streams each year (Figure 2). Some of the statistical survey locations may correspond to existing fixed Base Sites. Each statistical survey site will be sampled monthly for one year and will be prioritized for a macroinvertebrate community and habitat analysis. Streams of different sizes may be more or less sensitive to different types of environmental perturbations. Because of this, three stream sizes have been specifically targeted to ensure they are represented in the selected statistical survey sites.

- 1. First Order streams, or headwater streams, are targeted because these represent streams with the least dilution capacity and therefore are most immediately impacted by adjacent land use activities and associated runoff. These streams may also serve as spawning areas for fish and refuge areas for young from larger aquatic predators.
- 2. Second and Third Order streams, which are also streams with relatively small dilution capacity and represent important habitat for reproduction and survival of aquatic life. They may also reflect the direct impacts of major land use activities.
- 3. Fourth Order and larger streams, which include the major rivers of the State. In general these streams have greater dilution capacity and are less affected by small-scale land use perturbations and may be heavily utilized for contact recreation.

These different sizes do not occur in equal proportions in the state, therefore an unequal weighting procedure is used in the site selection process to guarantee inclusion of all three sizes. Taken together and using the proper weighting factors, the random stream sites can be used to make statistically valid statements about all stream resources of the State.

Samples are collected and field measurements conducted by Bureau of Environmental Health Services personnel from the corresponding SCDHEC Field Laboratory Office following the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Sections 3, 7, 14, and 19. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology-- ARESD. The 2020 Statistical survey Stream Sites are distributed by Field Laboratory Offices as follows:

Greenville	6	Florence	9
Aiken	7	Columbia	3
Charleston	1	Lancaster	3
Beaufort	1		

Statistical survey Stream Sites and location descriptions are listed by Field Laboratory Office in Appendix A, and by waterbody name in Appendix B. Parameter coverage, frequency of analysis, and STORET parameter codes are given in Appendices C and D.

### Lakes/Reservoirs

Approximately 30 statistical survey sites will be sampled in lakes/reservoirs each year (Figure 2). Some of the statistical survey locations may correspond to existing fixed Base Sites. Each statistical survey site will be sampled monthly for one year. Eligible lakes/reservoirs are restricted to "significant lakes", which refers to those freshwater lakes/reservoirs with at least 40 acres surface area that offer unrestricted public access. The size of significant lakes/reservoirs varies immensely; therefore two size classes of lakes/reservoirs have been specifically targeted to ensure that the smaller lakes/reservoirs are represented in the selected statistical survey sites.

- 1. Major Lakes/Reservoirs greater than 850 acres surface area.
- 2. Minor Lakes/Reservoirs greater than 40 acres surface area, but less than or equal to 850 acres.

These different sizes do not occur in equal proportions in the state, therefore an unequal weighting procedure is used in the site selection process to guarantee inclusion of both sizes. Taken together and using the proper weighting factors, the statistical survey lake/reservoir sites can be used to make statistically valid statements about all lake/reservoir resources of the State.

Samples are collected and field measurements conducted by Bureau of Environmental Health Services personnel from the corresponding SCDHEC Field Laboratory Office following the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Sections 3, 7, 14, and 19. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology-- ARESD. The 2020 Statistical survey Lake/Reservoir Site network is regionally organized with the following assignments:

Greenville	11	Florence	0
Aiken	4	Columbia	4
Charleston	1	Lancaster	4
Beaufort	0		

In addition, 6 Statistical survey Lake/Reservoir Sites will be collected by the Santee Cooper Public Service Authority in a cooperative effort. Statistical survey Lake/Reservoir Sites and location descriptions are listed by Field Laboratory Office in Appendix A, and by waterbody name in Appendix B. Parameter coverage, frequency of analysis, and STORET parameter codes are given in Appendices C and D.

### Estuaries

The coastal estuarine statistical survey monitoring scheme has been developed jointly by SCDHEC, Bureau of Water, and the South Carolina Department of Natural Resources (SCDNR), Marine Resources Research Institute (MRRI). This effort has been dubbed the South Carolina Estuarine and Coastal Assessment Program (SCECAP) and sampling of the statistical survey coastal estuarine sites is a cooperative venture between SCDHEC and SCDNR-MRRI. To ensure inclusion of a variety of estuarine ecosystems and habitats, the coastal estuaries have been divided into two discrete categories (strata) based on a common GIS cover developed and utilized by both agencies.

- 1. Tidal Creeks, identified as less than 100 meters wide on the GIS cover, serve as nursery areas for important marine species and are most immediately affected by upland land use activities and associated runoff.
- 2. Open Water areas, identified as greater than 100 meters wide on the GIS cover, represent larger estuarine rivers and sounds.

Within these waterbody types there are typically two distinct types of monitoring sites based on sampling frequency, Core Sites and Supplemental Sites. Core Sites (Figure 2) are sampled monthly for one year by SCDHEC Bureau of Environmental Health Services personnel from the corresponding SCDHEC Field Laboratory Office for water column physical and chemical parameters following the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Sections 3, 7, 14, and 19. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology-- ARESD. SCDNR-MRRI samples annually for sediment chemistry, sediment physical characteristics, sediment toxicity, benthic infaunal community composition, up to 25-hour multi-parameter datasonde deployments, and fish trawls following the QAPP developed for the USEPA National Coastal Assessment Program. SCDNR-MRRI also collects additional water samples in SCDHEC supplied containers for analysis by SCDHEC according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology-- ARESD.

When resources are available, additional Supplemental Sites may be selected and sampled. The Supplemental Sites are sampled one time by SCDNR-MRRI for sediment chemistry, sediment physical characteristics, sediment toxicity, benthic infaunal community structure, up to 25-hour multi-parameter datasonde deployments, and fish trawls.

Each year there will be approximately 15 Core Tidal Creek sites, 15 Core Open Water sites, and when resources are available, additional Supplemental Tidal Creek and Open Water sites may be sampled. Some of the statistical survey locations may correspond to existing fixed Base Sites.

The total number of Core 2020 Statistical survey Estuary Sites is distributed between three Field Laboratory Offices with the following assignments:

Charleston	14	Florence	2
Regufort	14		

Core Tide Creek and Core Open Water Sites and location descriptions are listed by Field Laboratory Office in Appendix A, and by waterbody name in Appendix B. Parameter coverage, frequency of analysis, and STORET parameter codes are given in Appendices C and D.

### 2.1.2.4 Waters of Concern Monitoring Sites

There are 36 identified Waters of Concern (Figure 3). Waters of Concern represent legacy monitoring sites that are no longer actively being sampled that old data suggest may have water quality concerns but lack the necessary ancillary data to properly calculate the appropriate water quality standard. These sites are now going to be actively sampled again to compile a more current, complete, dataset to re-evaluate water quality condition.

Greenville	13	Florence	3
Aiken	2	Columbia	8
Charleston	0	Lancaster	10
Beaufort	0	ASP	0

Waters of Concern and location descriptions are listed by Field Laboratory Office in Appendix A, and by waterbody name in Appendix B. Parameter coverage, frequency of analysis, and STORET parameter codes are given in Appendices C and D.

## 2.1.3 Schedule for the Ambient Surface Water Quality Monitoring Program for Calendar Year 2020 by Field Laboratory Office

The following is the schedule for collection of non-monthly parameters for each Regional Laboratory Office. The schedule includes the number of each type of sample to be collected, and it also includes the month(s) for collection. All other parameters, with the exception of chlorophyll a, are collected every month. Please refer to Appendix C and Appendix D for details relevant to specific parameters for each station.

### 2.1.4 Core and Supplemental Water Quality Indicators

Table 1 lists the primary Core Indicators used in making use support determinations and additional Supplemental Indicators that are also collected. Because of the statewide scale of the routine surface water monitoring program, the choice of supplemental indicators is dictated by laboratory capacity and resources, and the general utility of the resulting data in identifying potential sources contributing to nonattainment of designated uses on a large scale. Assessment of designated use support often includes the use of data generated by other Ambient Water Quality Monitoring programs detailed in the following sections.

Appendix D provides a more detailed list of the basic parameters measured customarily as part of routine Surface Water Physical & Chemical Monitoring activities. Detailed information for individual monitoring locations is included in Appendix C.

### 2.1.5 Quality Assurance

All sampling procedures and analyses are performed under the SCDHEC Quality System which is described in the USEPA approved Quality Management Plan For S.C. DHEC, with the supervision of the Quality Assurance Manager (QAM) and all procedures follow the most current revisions of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Sections 3, 7, 14, and 19, BEHSPROC 200 - Ambient Surface Water Sampling, BEHSPROC 201- Field Temperature Measurement in Surface Water, BEHSPROC 202 - Field Dissolved Oxygen Measurement in Surface Water, BEHSPROC 203 - Field pH Measurement in Surface Water, and BEHSPROC 205 - Multi-Parameter Field Measurements in Surface Water, as appropriate, and Procedures and Quality Control Manual for Chemistry Laboratories--ARESD, and Laboratory Procedures Manual for Environmental Microbiology-- ARESD. Please see Section 2.7 of this strategy, Quality Assurance/Quality Control Procedures, for further details.

### 2.1.6 Data Management

Routine ambient stream samples are collected by Regional Office personnel with some analyses conducted in the Regional Laboratories and others by the Central Laboratory. Data for samples that are analyzed in the Regional Laboratories are reported on the appropriate data sheets and released by the sample custodian for the region. These data sheets are sent to the Analytical and Radiological Environmental Services Division in Columbia where they are sent to the appropriate program areas.

All Ambient Surface Water Physical & Chemical Monitoring data are received by Aquatic Science Programs from the Data Management Section, Bureau of Environmental Health Services. The data are reviewed, edited and stored into the IMAP database. The Aquatic Science Programs performs a 10 percent review of all data to ensure quality assurance of the data. The data are uploaded to the National Water Quality Monitoring Council's Water Quality Portal water quality database at <a href="https://www.waterqualitydata.us/">https://www.waterqualitydata.us/</a>. Data sheets are kept on file in the Aquatic Science Programs.

### 2.1.7 Data Analysis/Assessment

The SCDEHC data analysis and assessment methodology used to make attainment decisions about State waters is included as part of the Integrated Report, which is submitted to EPA on even numbered years for review and approval. The most recent version is published in the most current version of the *State of South Carolina Integrated Report Part I: Listing of Impaired Waters* which can be found on the SCDHEC website at

<u>http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/</u>. Specific limits on assessment decision rules are listed below.

### 2.1.8 Reporting

Data generated by the Ambient Surface Water Physical & Chemical Monitoring Program are used routinely in the preparation of the biennial Integrated Report, which addresses Clean Water Act §303(d), §305(b), and §314 reporting requirements. These reports are available on the SCDHEC website <a href="http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/">http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/</a>.

These data are internally and publicly available and may be used by other program areas for other purposes, including triennial water quality standards reviews, use attainability analyses (UAAs), standards revisions, water quality based effluent limits (WQBELs) in permits, total maximum daily loads (TMDLs), nonpoint source programs, and other watershed plans.

Limits on Assessment Decision Rules

Parameter	Parameter Range	Null Hypothesis	Tolerable Limit	Consequence of Decision Error	Corrective Action	Gray Region	Probability Value
Chemical	Most current South Carolina Regulation 61-68 Water Classifications and Standards Most current South Carolina Regulation 61-69 Classified	Waterbody does not exceed criteria	For conventional pollutants 90% of data points fall within criteria For potentially	Place on §303(d) list erroneously	Additional data are collected and assessment revised. Waters removed from the §303(d) list	Macro- invertebrate data indicates aquatic life use is fully supported and chemical data exceed	Aquatic life use support decision is based on macro- invertebrate results
	Waters		toxic pollutants no more than 2 samples exceed appropriate chronic or acute criteria			criteria	
Bacterio-	Most current	Waterbody	90% of	Place on	Additional		Support

Parameter	Parameter Range	Null Hypothesis	Tolerable Limit	Consequence of Decision Error	Corrective Action	Gray Region	Probability Value
logical	South Carolina Regulation 61-68 Water Classifications and Standards	does not exceed criteria	data points fall within criteria or guidelines	§303(d) list erroneously	data are collected and assessment revised. Waters removed from the §303(d) list		decision is based on criteria and approved assessment methodology

### 2.2 Ambient Surface Water Physical & Chemical Continuous Monitoring

### 2.2.1 Monitoring Objectives

The purpose of Ambient Surface Water Physical & Chemical Continuous Monitoring is to investigate temporal, as well as spatial variation of specific parameters, in a way that produces well defined data reflecting physical and chemical relationships of the streams, reservoirs and estuaries in South Carolina.

### 2.2.2 Monitoring Design

Continuous monitoring sampling sites are located in systems (reservoirs, streams, estuaries) where discrete monthly sampling is insufficient for specific purposes. Monitoring sites are positioned so as to complement existing discrete monitoring locations and to fully characterize the system to the greatest extent possible. Continuous monitoring datasondes are deployed on buoys, or affixed to floating docks if available, at two week intervals. Monitoring at a depth of 0.3 meters is continuous (15 minute intervals) throughout the growing season (May1 –October 31). The deployment period for individual meters, or for the complete study, may be altered depending on physical constraints and the objectives of the study.

### 2.2.3 Core and Supplemental Water Quality Indicators

The datasonde firmware calculates salinity from temperature and conductivity and makes any needed temperature adjustments to DO readings. Notification of updated firmware is pushed to the end-users by the manufacturer and is installed to the datasondes by SC DHEC personnel.

Results are reported as follows. The number of significant digits is dictated by the sensor precision of each measurement. Please see the datasonde-specific SOP.

Temperature – °C Conductivity – mS/cm Salinity – PPT (estuarine only) pH – Standard Units LDO – mg/L Chlorophyll *a* – μg/L

### Turbidity – NTU

### 2.2.4 Quality Assurance

All continuous monitoring procedures and data analyses are performed in accordance with the Bureau of Water, <u>Standard Operating Procedure for Continuous Monitoring of Ambient Surface Water</u> (Attachment 1).

### 2.2.5 Data Management

Once a datasonde is verified after deployment the raw data are downloaded to a DHEC database which is backed up nightly.

### 2.2.6 Data Analysis/Assessment

Calibration, validation, and verification criteria for continuous monitoring data are listed in the table below. Failure to meet these criteria during instrument calibration and validation requires that the calibration be performed again and possibly new standards made. Post-deployment verification occurs prior to cleaning and maintaining the datasonde. If verification fails the first time, the datasonde is cleaned and the verification is performed again.

Post processing of the data may be performed according to the <u>Standard Operating Procedure for Continuous Monitoring of Ambient Surface Water</u> (Attachment 1), and the data may still be used if it meets the Maximum Allowable Limits for Data Adjustment listed in the <u>Standard Operating Procedure for Continuous Monitoring of Ambient Surface Water</u> (Attachment 1), subject to data quality objectives.

Parameter	USGS Calibration Verification Criteria (Wagner et al., 2006)	BOW Calibration Verification Criteria
Temperature	± 0.2 °C	Secondary confirmation with NIST thermometer at least once during field season. $\pm 0.1 ^{\circ}\text{C}$
Specific Conductance	± 5 μS/cm or ±3 % of the measured value, whichever is greater	±10%
Dissolved oxygen	$\pm~0.3~{ m mg/L}$	± 0.2 mg/L
pН	± 0.2 pH unit	± 0.2 unit
Turbidity	± 0.5 NTU or ± 5% of the measured value, whichever is greater	± 10%
Chlorophyll <i>a</i>	None	± 10%

### 2.2.7 Reporting

Continuous monitoring data are reported within the final report for which the data was used.

### 2.3 Ocean Water Monitoring

### 2.3.1 Monitoring Objectives

The objective of South Carolina's ocean water monitoring program is to protect public health through the issuance of swimming advisories based on accurate, representative sampling.

### 2.3.2 Monitoring Design

Sampling sites are located along the beachfront based on public access points. Additional sites are located near problem areas such as swashes and storm drain outfalls. Each site location has been recorded with global positioning systems (GPS) technology and mapped. Samples are collected at knee depth (approximately two feet) to best represent the area where recreation normally occurs. See Appendix E for sample site locations at the time of this publication. As swimming season approaches some modification to sample sites may be made. There are a total of 123 currently active sites in three regions monitored according to the following monitoring design:

		Tier 1	Tier 2	
A. When to Conduct Basic Sampling		May 1 - October 1 Once per week Random tidal stages	May 1 - October 1 Twice per month Random tidal stages	
B. When to Conduct Additional Sampling	Rainfall events	N/A	N/A	
	After a water quality standard is exceeded	If any sample exceeds the action level a repeat sample will be taken within 24 hours of result notification, except where a permanent advisory sign is in place.		
	After a sewage spill or pollution event	Sampling will be conducted as soon as possible following a sewage spill or other pollution event. At the region manager's discretion, beaches will be preemptively placed under advisory until satisfactory sample results are received.		
	Reopening after advisory or closure	Additional samples shall be taken following an advisory until sample results fall below the action level and advisory is lifted.		

Further information regarding the monitoring design and sample site selection criteria can be found in <u>South Carolina Beach Monitoring Program Quality Assurance Project Plan</u>, Appendix B.

### 2.3.3 Core and Supplemental Water Quality Indicators

The State records the following parameters for each ocean water sample: project code and county location, sample date, sampling time, station number, sample collector, sample identification numbers, weather conditions, rainfall amount in previous 24 hours, tidal condition, wind direction, enterococci (most probable number based on the Enterolert Quanti-tray sample method), chain of custody, and comments. Of the parameters listed, the only critical measurement is the Enterolert result. Other parameters are collected primarily for informational purposes only.

### 2.3.4 Quality Assurance

All sampling procedures and analyses are performed in accordance with the <u>South Carolina Beach</u> Monitoring Program Quality Assurance Project Plan.

### 2.3.5 Data Management

Copies of the completed Ocean Water Quality Sampling Data forms (DHEC 2508) are entered into IMAP by the Program Coordinator in Central Office. A hard copy of the form is maintained by the Field Laboratory and the original is sent to the Central Office. Data sheets are kept for three years per the retention schedule. At the end of the beach season, all data is uploaded to the EPA. Data are also available to the public by request and on the beach monitoring Web site <a href="http://gis.dhec.sc.gov/beachaccess/#">http://gis.dhec.sc.gov/beachaccess/#</a>.

### 2.3.6 Data Analysis/Assessment

Swimming advisories are issued based on a single sample limit of 500 Enterococci/100 mL or a

single sample exceeding 104 Enterococci/100 mL followed by a repeat sample exceeding 104 Enterococci/100 mL. When an extreme weather event, such as a hurricane, tropical storm, or torrential rain occurs, a general advisory may be issued without current sampling data. It is known that significant rainfall within a 24-hour period causes elevated bacteria counts that exceed the advisory action levels at some stations. Data assessment procedures can be found in the South Carolina Beach Monitoring Program Quality Assurance Project Plan Appendices D and E.

### 2.3.7 Reporting

In the event of an advisory, signs will be posted at conspicuous areas on the affected beach, if needed. Some sampling sites are permanently advised. Beach advisory signs includes a statement that explains that swimming is not advised due to high bacteria levels in the water, but that wading, fishing, and shell collecting do not pose a risk and list contact information. Local media outlets are contacted by the regional program manager or the municipality as previously negotiated. A copy of the advisory is sent by electronic mail to the program coordinator and each coastal regional EA office (Myrtle Beach, Beaufort, and Charleston). Advisories are also available through the DHEC website. All advisory data are uploaded at least yearly to EPA. Further information regarding reporting is available in the South Carolina Beach Monitoring Program Quality Assurance Project Plan, Section A9 and Appendix C.

### 2.4 Biological Monitoring

The biological monitoring network provides information that will allow for the detection and evaluation of changes in the stability of aquatic communities, including macroinvertebrates and phytoplankton, and the analysis of fish tissue. The various activities falling under the biological monitoring program are detailed below.

### 2.4.1 Macroinvertebrate Bioassessment

Ambient stream macroinvertebrate bioassessments are currently focused on monitoring the condition of stream water quality statewide and include an expanded array of large river sites. Emphasis is placed on building datasets with a long history of frequent sampling to allow for better resolution in the identification of water quality trends. Additionally, biological monitoring continues at statistical survey and special study stations statewide. Review of reports required by NPDES permits is ongoing.

### 2.4.1.1 Monitoring Objectives

The South Carolina Department of Health and Environmental Control began using aquatic macroinvertebrates in environmental studies in 1974 (SCDHEC 1974, 1975). Since then the macroinvertebrate monitoring program has become an important part of the Agency and is utilized for: trend monitoring of streams and rivers, the results of which are included in the §305(b) report to congress, reporting of streams that do not meet aquatic life uses to be included on the §303(d) list, assessment of the potential impacts of NPDES discharges into waters of the state, evaluation of impacts of catastrophic events such as oil spills, evaluation of the effects of nonpoint source impacts on streams and rivers, evaluation of potential outstanding resource waters of the state, providing data

for conservation agencies and programs, documenting biodiversity, and demonstrations for volunteer monitoring programs, school groups, 4H groups, and environmental festivals in the state of South Carolina. In addition bioassessments help inform standards as the results are direct measures of aquatic life condition of waters of the Nation.

# 2.4.1.2 Monitoring Design

Sampling sites for macroinvertebrate bioassessments fall into three broad categories: fixed stations, special study stations, and statistical survey stations. Fixed stations were once sampled on a rotating basin schedule with approximately 80 stations completed per year. Thus each site was typically sampled once every 5 years. Currently, 80 of these sites are being sampled every 3 years so that any trends might be observed in greater resolution. The remaining fixed stations are sampled as often as resources allow. These fixed stations were established by professional judgment. Criteria for site selection included watershed area, stream size, accessibility, and proximity to surface water quality stations. In general, fixed site macroinvertebrate bioassessments are conducted on mid-order or larger flowing streams. The resulting data represent the present condition of these streams.

Special studies are conducted as needed and are generally completed in order to evaluate potential perturbation from point source or non-point source events. Examples include chemical releases, oil spills, forestry activities, or development activities. Generally, these studies involve comparing an upstream control station with a station downstream of the potential impact. These studies can be a one-time event or may continue over months or years.

Statistical survey station sampling occurs during the normal fixed station index period. These sites may fall anywhere in the state. Because the selection process is random, these sites change from one year to the next. Collectively, data from the statistical survey sites provide an overview of conditions in the streams and rivers of the state.

# 2.4.1.3 Core and Supplemental Water Quality Indicators

Ecological health of the aquatic macroinvertebrate community is determined using a variety of biometrics outlined in the most current revision of SCDHEC's <u>Environmental Investigations Standard Operating Procedures and Quality Assurance Manual</u>, Section 8. The EPT (Ephemeroptera, Plecoptera, and Trichoptera) Index and Biotic Index are used to calculate a Bioclassification Score, which will be used to determine the aquatic life use support rating of the stream or river. On rare occasions other metrics may be evaluated such as Taxa Richness and Total Count, and professional judgment used to determine the final aquatic life use rating. For special study stations, it is the change in the bioclassification score from the upstream control site to the downstream test site that will determine the level of impairment an activity may have on a stream.

#### 2.4.1.4 Quality Assurance

All sampling procedures and analyses are performed under the SCDHEC Quality System which is described in the USEPA approved <u>Quality Management Plan For S.C. DHEC</u>, with the supervision of the Quality Assurance Manager (QAM) and all procedures follow the most current revision of SCDHEC's <u>Environmental Investigations Standard Operating Procedures and Quality Assurance</u>

Manual, Sections 8, 14, and 19. Please see Section 2.7 of this strategy, Quality Assurance/Quality Control Procedures, for further details.

# 2.4.1.5 Data Management

Macroinvertebrate and habitat data are entered into an in-house relational database program. This database program generates metric calculations and reports. All data are available to the public through the Freedom of Information Act. Coverage of the macroinvertebrate monitoring stations is available through an in-house Geographic Information System.

## 2.4.1.6 Data Analysis/Assessment

Refer to most current revision of SCDHEC's <u>Environmental Investigations Standard Operating Procedures and Quality Assurance Manual</u>, Section 8. Specific limits on assessment decision rules are listed below.

Limits on Assessment Decision Rules

Parameter	Parameter Range	Null Hypothesis	Tolerable Limit	Consequence of Decision Error	Corrective Action	Gray Region	Probability Value
Macro- invertebrate	Most current South Carolina Regulation 61- 68 Water Classifications and Standards Most current revision of Environmental Investigations Standard	Waterbody does not fall below regional guidelines Aquatic Community below point source is similar to community	Index values meet or exceed regional guidelines  Difference between upstream and downstream index value	Place on §303(d) list erroneously  Point source discharger is required to investigate potential cause of condition	Additional data are collected and assessment revised. Waters removed from the §303(d) list	Bio- assessment scores can be affected by non- anthropogenic stressors.  Discharge into headwater streams lack	Support decision is based on field, habitat, or chemical data
	Operating Procedures and Quality Assurance Manual, Section 8.4	at upstream control	is no greater than guidelines		Continued monitoring to determine variability	upstream control.	

### 2.4.1.7 Reporting

Macroinvertebrate community assessment conclusions are shared within the Aquatic Science Programs for consideration in the development of assessments pursuant to §303(d) and §305(b) of the Clean Water Act.

#### 2.4.2 Fish Tissue Monitoring

#### 2.4.2.1 Monitoring Objectives

The collection of fish for the purpose of tissue analysis is necessary to detect the presence and levels of heavy metals, pesticides and toxic organic compounds in edible tissue that may concentrate through aquatic food chains and threaten the health of human consumers. Aquatic organisms may

accumulate contaminants through gills and epithelial tissue directly from water and sediment (bioconcentration), a combination of bioconcentration and dietary sources (bioaccumulation), or a process by which the tissue concentrations increase as the contaminant passes up the food chain (biomagnification). Data collected is used to issue consumption advisories for the protection of public health when necessary.

## 2.4.2.2 Monitoring Design and Core and Supplemental Indicators

A Statewide Survey for mercury contamination was initiated in 1993. This sampling will be continued in CY 2020. Largemouth bass (*Micropterus salmoides*) and one other common game fish will be sampled at approximately 60 freshwater sites. Fish tissue sites are established for lakes, rivers, and streams based on river miles or surface acreage. Generally at least ten samples from each site will be analyzed for mercury and one to two samples from each site will be analyzed for other heavy metals, pesticides and PCBs. Monitoring sites locations are listed in Appendix G.

Through a cooperative effort, the South Carolina Department of Natural Resources, Marine Resources Research Institute, is furnishing saltwater fish each year from estuaries for tissue analysis. Red drum, spotted sea trout, and southern flounder are the target species. Emphasis will be placed on Upper and Lower Cape Romain, the Ashley River, Charleston Harbor, Winyah Bay, the ACE basin, and the Wando River. SCDNR also provides samples of swordfish, wahoo, dolphin, and tuna for tissue analysis, as available. Through a cooperative effort with other coastal Southeastern states, King mackerel and Spanish mackerel will be collected from selected tournaments and SCDNR routine sampling. The resulting data will be used to supplement the current advisories on mackerel. Tissue from select other saltwater species will be obtained as they become available.

#### 2.4.2.3 Data Assessment

The SCDHEC uses a risk-based approach to evaluate contaminant concentrations in fish tissue and to issue consumption advisories in affected waterbodies. This approach contrasts the average daily exposure dose to the reference dose (RfD). Using these relationships, fish tissue data are interpreted by determining the consumption rates that would not be likely to pose a health threat to adult males and nonpregnant adult females. Because an acceptable RfD for developmental neurotoxicity has not been developed and because scientific studies suggest that exposure before birth may have adverse effects the health of infants, pregnant women, infants, and children are advised to avoid consumption of fish from any waterbody where an advisory has been issued. Specific limits on assessment decision rules are listed below.

Limits on Assessment Decision Rules

Parameter	Parameter Range	Null Hypothesis	Tolerable Limit	Consequence of Decision Error	Corrective Action	Probability Value
Fish Tissue	Most current South Carolina Regulation 61-68 Water Classifications and Standards Most current revision of Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Section 8.5	Fish tissue samples do not exceed risk-based contaminant concentration	Tissue concentration meet risk- based contaminant concentration	Place on §303(d) list and issue fish consumption advisory erroneously	Additional data are collected and assessment revised. Waters removed from the §303(d) list	Support decision is based on accepted risk- based approach

#### 2.4.2.4 Quality Assurance

All sampling procedures and analyses are performed under the SCDHEC Quality System which is described in the USEPA approved Quality Management Plan For S.C. DHEC, with the supervision of the Quality Assurance Manager (QAM) and all procedures follow the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Section 8. All laboratory analyses are performed according to the most current revision of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--AERSD. Please see Section 2.7 of this strategy, Quality Assurance/Quality Control Procedures, for further details.

#### 2.4.2.5 Data Management

After samples are collected, data sheets are kept on file in the Aquatic Science Programs until sample analysis is completed. Upon completion of analysis, any physical or chemical data are placed in National Water Quality Monitoring Council's Water Quality Portal water quality database at <a href="https://www.waterqualitydata.us/">https://www.waterqualitydata.us/</a>. Fish tissue results are entered into an Excel database and hard copies are filed and kept on site. The tissue data are currently being entered and stored in a separate database that will be uploaded to National Water Quality Monitoring Council's Water Quality Portal water quality database at <a href="https://www.waterqualitydata.us/">https://www.waterqualitydata.us/</a> or a similar data tracking system.

# 2.4.3 Phytoplankton & Chlorophyll Monitoring

Phytoplankton are the microscopic plants that live free-floating and suspended in bodies of water. The abundance of phytoplankton can strongly influence non-biological aspects of water quality such as pH, dissolved oxygen, color, taste, and odor. Certain species of phytoplankton flourish in highly eutrophic (nutrient enriched) waters while distinct types are very sensitive to organic and/or other chemical wastes. Some species are capable of producing noxious blooms in the form of highly turbid water, floating algal mats, or surface scums. Offensive odors and tastes may develop from these blooms, thereby spoiling a water resource for its various uses. Anoxic conditions that may kill fish and other aquatic life can also result from excessive algal blooms. Toxic conditions resulting in

human illness and animal deaths can be created by a few phytoplankton species. Chlorophyll *a* is an indirect measure of phytoplankton biomass that can serve as a warning of the potential to develop nuisance algae bloom conditions. The algal biomass is therefore likely to be indicative of water quality in a selected water body.

Consequently, chlorophyll a analyses is a particularly useful biological indicator for assessing nutrient enrichment in water bodies and can aid in management decisions for protecting water resources. Chlorophyll a can be used to assess current water quality in lakes/reservoirs of interest and to provide a baseline of data to observe any potential changes. In addition, the effectiveness of management actions to control nutrient enrichment can be evaluated through a continuing chlorophyll monitoring program.

## 2.4.3.2 Monitoring Design

Sites for chlorophyll monitoring are selected using an integrated approach to best characterize the quality status of the State's waters. This process includes designating a variety of sites including fixed-station and statistical survey design. Individual sites monitored for chlorophyll *a* are designed to be representative of segments (e.g. estuary) or areas (embayment of lake) of targeted water bodies. Collectively, monitored sites provide an overview of conditions in specific resource types (e.g. coastal estuaries, lakes/reservoirs, etc.).

For CY 2020, chlorophyll *a* samples will be collected monthly, May through October, at the 30 selected lake statistical survey sites, 37 Base Lake Sites, 44 Base Estuary Sites and 6 Special Request Sites on lakes. These sites represent all lake locations among the current Base Sites, Special Request Lake Sites, and all Statistical Survey Lake Sites and all Core Statistical Survey Estuarine Sites. It also includes 3 Base Sites and 5 Statistical Survey Lake Sites collected by the Santee Cooper Public Service Authority in a cooperative effort.

# 2.4.3.3 Core and Supplemental Water Quality Indicators

Chlorophyll *a* is a core indicator for lake/reservoirs habitats that can be used for direct comparison to numeric State standards. In estuaries, where numeric standards are under development, it serves as a supplemental indicator.

#### 2.4.3.4 Quality Assurance

All sampling procedures and analyses are performed under the SCDHEC Quality System which is described in the most current USEPA approved <u>Quality Management Plan</u> South Carolina Department of Health and Environmental Control, with the supervision of the Quality Assurance Manager (QAM) and all procedures follow Chlorophyll a Laboratory Methods, SCDHEC Technical Report 0609-15. Please see Section 2.7 of this strategy, Quality Assurance/Quality Control Procedures, for further details.

#### 2.4.3.5 Data Management

Chlorophyll data are placed in National Water Quality Monitoring Council's Water Quality Portal water quality database at <a href="https://www.waterqualitydata.us/">https://www.waterqualitydata.us/</a> where it is directly accessible by the

general public via the internet. In general, chlorophyll *a* data are entered into the Water Quality Portal at least annually.

### 2.4.3.6 Data Analysis/Assessment

Assessment of Chlorophyll *a* data are included in the SCDEHC data analysis and assessment methodology used to make attainment decisions about State waters included in the Integrated Report, which is submitted to EPA on even numbered years for review and approval. The most recent version is published in the most current version of the *State of South Carolina Integrated Report Part I: Listing of Impaired Waters* which can be found on the SCDHEC website at <a href="http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/">http://www.scdhec.gov/HomeAndEnvironment/Water/ImpairedWaters/Overview/</a>.

## 2.4.3.7 Reporting

Chlorophyll *a* assessment conclusions are forwarded to the Aquatic Science Programs for consideration in the preparation of the biennial Integrated Report, which addresses Clean Water Act §303(d), §305(b), and §314 reporting requirements. These reports are available on the SCDHEC website.

## 2.5 Shellfish Growing Area Water Quality Monitoring

# 2.5.1 Monitoring Objectives

South Carolina's Shellfish Sanitation Program monitors approximately 580,176 acres of surface water with assigned classifications designated for the harvest of Molluscan shellfish. These coastal waters are divided into 25 shellfish management areas with a total of 463 active monitoring stations. The objectives of the shellfish-monitoring network are to provide data that accurately reflect sanitary and environmental conditions of coastal shellfish and shellfish growing waters in South Carolina in order to:

- Ensure that the health of shellfish consumers is protected;
- Protect and maintain existing shellfish growing area water use; and
- Identify impaired waters suitable for restoration to appropriate use standards.

#### 2.5.2 Monitoring Design

The shellfish-monitoring program provides the database that is used in conducting a comprehensive evaluation of each shellfish growing area. Evaluations of growing areas, which meet NSSP requirements for Triennial Reviews, are conducted annually. Routine bacteriological monitoring and subsequent laboratory analyses of water quality from strategically located sample sites are conducted monthly. Monitoring is based on a systematic random sampling methodology in which coastal shellfish growing area surface waters are sampled in accordance with a pre-established schedule, thereby assuring that a statistically representative cross-section of meteorological, hydrographic, and/or pollution events will be included in the data set. Monitoring sites are established at locations representative of variable water quality within non-Prohibited classified shellfish areas. Locations

are sited with the intent of determining compliance with existing State shellfish regulation water quality standards. Individual monitoring sites are typically representative of a water reach extending in the directions of tidal flow to the closest adjacent monitoring sites. Resulting laboratory analyses detail physical and bacteriological data that are used to classify shellfish growing waters. All standards, monitoring methodology, and laboratory analyses comply with guidance set forth in the National Shellfish Sanitation Program Model Ordinance. Areas closed to the harvesting of shellfish are posted with signs indicting the potential for serious illness from consuming shellfish harvested within these areas and outlining penalties for harvest violations.

The monitoring network also serves to update sanitary-related data from each shellfish area to ensure that conditions that existed during the prior review period still prevail; that the harvest classification is correct; and, ultimately that shellfish are harvested only from growing areas that meet or exceed established standards for shellfish growing waters.

Complete descriptions of station locations are included in Appendix H.

### 2.5.3 Core and Supplemental Water Quality Indicators

Fecal coliform, used as a human pathogen indicator organism, is the bacteriological parameter used to decide between the *Approved* and *Restricted* classifications (Table 2). Additional monitoring parameters (Salinity, Tide Stage, Wind Direction, etc.) are frequently used in conjunction with the fecal coliform standard and observed meteorological and/or hydrographic conditions in determining the appropriateness of implementing the *Conditionally Approved* classification.

#### 2.5.4 Quality Assurance

Shellfish Sanitation Program monitoring complies with most current revision of SCDHEC's EA Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, Section 8.10, and all laboratory analyses are conducted by the Bureau of Environmental Health Services according to the most current revision of SCDHEC's <u>Laboratory Procedures Manual for Environmental Microbiology-- ARESD</u>.

#### 2.5.5 Data Management

Shellfish data are stored in STORET. Individual data collected subsequent to the mid-1990s are available through FOI request in an electronic (Excel) format. All monitoring sites are represented in a digital coverage located on the Department's GIS server.

#### 2.5.6 Data Analysis/Assessment

S.C Regulation 61-47, Shellfish, has established a fecal coliform standard (geometric mean not to exceed 14 fc mpn/100ml and the estimated 90<sup>th</sup> percentile value not to exceed 43 mpn/100ml) for waters classified as *Approved*. Sites are monitored on a monthly basis, with monitoring scheduled in advance so as to be random with respect to tide and weather conditions. Data collected over a thirty-six consecutive month period is used in determining compliance. A minimum of thirty samples is required to be collected from each monitoring site for classification. This standard and methodology fully complies with National Shellfish Sanitation

Program Model Ordinance guidance criteria. All shellfish waters receive one of the following harvest classifications.

Table 2. Fixed-Station Shellfish Monitoring Program Physical and Bacteriological Parameter Coverage and Sampling Frequency

Parameter Group	Parameter	Water	Shellstock	
Physical	Tide Stage	*	NA	
•	Water Temperature	*	NA	
	Air Temperature	*	NA	
	Wind Direction	*	NA	
	Salinity	*	NA	
Bacteriological	Fecal Coliform	*	**	
J	Total Plate Count	NA	**	
	E. coli	**	**	
	Sample Temperature	*	**	
	Sample Type	NA	**	
	Species	NA	**	

<sup>\*</sup>Sampled monthly (minimum frequency).

2.5.6.1 Approved: Growing areas shall be classified Approved when the sanitary survey concludes that fecal material, pathogenic microorganisms, and poisonous or deleterious substances are not present in concentrations which would render shellfish unsafe for human consumption. Approved area classification shall be determined upon a sanitary survey, which includes water samples collected from stations in the designated area adjacent to actual or potential sources of pollution. For waters sampled under adverse pollution conditions, the median fecal coliform Most Probable Number (MPN) or the geometric mean MPN shall not exceed fourteen per one hundred milliliters, and not more than ten percent of the samples shall exceed a fecal coliform MPN of forty-three per one hundred milliliters (per five tube decimal dilution). For waters sampled under a systematic random sampling plan, the geometric mean fecal coliform Most Probable Number (MPN) shall not exceed fourteen per one hundred milliliters, and the estimated ninetieth percentile shall not exceed an MPN of forty-three (per five tube decimal dilution). Computation of the estimated ninetieth percentile shall be obtained using NSSP guidelines.

**2.5.6.2** Conditionally Approved: Growing areas may be classified Conditionally Approved when they are subject to temporary conditions of actual or potential pollution. When such events are predictable as in the malfunction of wastewater treatment facilities, non-point source pollution from rainfall runoff, discharge of a major river, potential discharges from dock or harbor facilities that may affect water quality, a management plan describing conditions under

<sup>\*\*</sup>Sampled as appropriate.

which harvesting will be allowed shall be adopted by the Department, prior to classifying an area as *Conditionally Approved*. Where appropriate, the management plan for each *Conditionally Approved* area shall include performance standards for sources of controllable pollution, e.g., wastewater treatment and collection systems, evaluation of each source of pollution, and means of rapidly closing and subsequent reopening areas to shellfish harvesting. Memorandums of agreements shall be a part of these management plans where appropriate.

Shellfish shall not be directly marketed from a *Conditionally Approved* area until conditions for an *Approved* classification have been met for a time that should insure the shellfish are safe for consumption. Shellstock from *Conditionally Approved* areas that have been subjected to temporary conditions of actual or potential pollution may be relayed to *Approved* areas for purification or depurated through controlled purification operations only by special permit issued by the Department.

**2.5.6.3 Restricted:** Growing areas shall be classified *Restricted* when sanitary survey data show a limited degree of pollution or the presence of deleterious or poisonous substances to a degree which may cause the water quality to fluctuate unpredictably or at such a frequency that a *Conditionally Approved* area classification is not feasible. Shellfish may be harvested from areas classified as *Restricted* only for the purposes of relaying or depuration and only by special permit issued by the Department and under Department supervision.

The suitability of *Restricted* areas for harvesting of shellstock for Relay or Depuration purposes may be determined through the use of comparison studies of background tissue samples with post-process tissue samples, as well as other process verification techniques deemed appropriate by the Department.

For *Restricted* areas to be utilized as a source of shellstock for depuration, or as source water for depuration, the fecal coliform geometric mean MPN of restricted waters sampled under adverse pollution conditions shall not exceed eighty-eight per one hundred milliliters and not more than ten percent of the samples shall exceed a MPN of two hundred and sixty per one hundred milliliters for a five-tube decimal dilution test. For waters sampled under a systematic random sampling plan, the fecal coliform geometric mean MPN shall not exceed eighty-eight per one hundred milliliters and the estimated ninetieth percentile shall not exceed an MPN of two hundred and sixty (five tube decimal dilution). Computation of the estimated ninetieth percentile shall be obtained using the formula outlined in the NSSP manual.

**2.5.6.4 Conditionally Restricted:** Growing areas may be classified *Conditionally Restricted* when they are subject to temporary conditions of actual or potential pollution. When such events are predictable, as in the malfunction of wastewater treatment facilities, non-point source pollution from rainfall runoff, discharge of a major river or potential discharges from dock or harbor facilities that may affect water quality, a management plan describing conditions under which harvesting will be allowed shall be prepared by the Department prior to classifying an area as *Conditionally Restricted*. Where appropriate, the management plan for each *Conditionally Restricted* area shall include performance standards for sources of controllable pollution, e.g., wastewater treatment and collection systems and an evaluation of each source of pollution, and description of the means of rapidly closing and subsequent reopening areas to shellfish

harvesting. Memorandums of agreements shall be a part of these management plans where appropriate.

Shellfish may be harvested from areas classified as *Conditionally Restricted* only for the purposes of relaying or depuration and only by permit issued by the Department and under Department supervision.

For Conditionally Restricted areas to be utilized as a source of shellstock for depuration, the fecal coliform geometric mean MPN of Conditionally Restricted waters sampled under adverse pollution conditions shall not exceed eighty-eight per one hundred milliliters and not more than ten percent of the samples shall exceed a MPN of two hundred and sixty per one hundred milliliters for a five-tube decimal dilution test. For waters sampled under a systematic random sampling plan, the fecal coliform geometric mean MPN shall not exceed eighty-eight per one hundred milliliters and the estimated ninetieth percentile shall not exceed an MPN of two hundred and sixty (five tube decimal dilution). Computation of the estimated ninetieth percentile shall be obtained using ISSP guidelines.

**2.5.6.5 Prohibited:** Growing areas shall be classified *Prohibited* if there is no current sanitary survey or if the sanitary survey or monitoring data show unsafe levels of fecal material, pathogenic microorganisms, or poisonous or deleterious substances in the growing area or indicate that such substances could potentially reach quantities which could render shellfish unfit or unsafe for human consumption. Waters classified as Prohibited are administrative closures.

Harvesting of shellfish for human consumption from Prohibited areas shall not be allowed by the Department. Shellfish may be depleted for non-food use from *Prohibited* areas upon approval of the Department and under specified conditions.

Growing waters adjacent to sewage treatment plant outfalls and other waste discharges shall be classified *Prohibited*. A variety of assumptions and criteria will be considered in determining the area that could be potentially impacted.

Growing waters within marinas shall be classified as *Prohibited*. Classification of waters adjacent to marinas will be determined using a dilution analysis that incorporates various assumptions.

2.5.6.6 Waters meeting the standard are typically classified as *Approved* and waters exceeding the standard are classified as *Restricted*. *Approved* waters approaching the standard's limit (14/43) or *Restricted* waters slightly exceeding the standard are candidates for management under the *Conditionally Approved* classification. Use of this classification requires that pollution events be predictable and manageable. Management of *Conditionally Approved* areas is manpower intensive and, although its use is encouraged; field managers are allowed some discretion in its implementation.

# 2.5.7 Reporting

The Shellfish Sanitation Program produces annual reports for each of the twenty-five shellfish

management areas. These reports are routinely distributed to the United States Food and Drug Administration, the South Carolina Department of Natural Resources, the Department's Office of Coastal Resource Management, and the Department's Bureau of Water – Division of Water Quality. All reports are updated annually and are available for viewing on the Department's Shellfish Sanitation Program webpage.

# 2.6 Groundwater Monitoring

Ambient groundwater monitoring is currently suspended. This section is reserved for future use as needed.

# 2.7 Quality Assurance/Quality Control Procedures

SCDHEC's Quality System is the means by which the Department implements the quality management process. The Quality System encompasses a variety of technical and administrative elements, which are outlined in the <u>SCDHEC Quality Management Plan</u>. This plan describes how programs within Environmental Affairs (EA) will plan, implement, and assess the quality of environmental work to be performed as part of the various programs' functions within the Agency.

The Director of Environmental Affairs has the overall responsibility for the development, implementation, and continued operation of EA's Quality Assurance (QA) Program. To ensure that EA's QA Program is uniformly applied to the generating and processing of all environmental data, a Quality Assurance Manager (QAM) has been appointed.

The QAM is responsible for the Quality Assurance Program. Environmentally-related measurement activities conducted by or for EA shall be done only with the approval of the QAM and/or QAM designee after ensuring that adequate quality assurance guidelines and procedures have been incorporated. This includes study-planning, sample collection, preservation and analysis, data handling, and use of physical, chemical, biological, and other data related to the effects, sources, transport and control of pollution, as well as personnel review and training.

### 2.7.1 Quality Assurance Project Plans and Standard Operating Procedures

Two basic tools for QA management are QA Project Plans (QAPPs) and Standard Operating Procedures (SOPs). Routine monitoring activities are implemented under this monitoring strategy (programmatic QAPP) and associated SOPs. Special studies require a written QAPP specific to that study. Special studies involving an immediate public health threat or a criminal investigation may not have an approved QAPP due to the limited time frame for obtaining samples. These studies will be handled like routine work requiring adherence to applicable SOPs. To accomplish the above, each environmental monitoring organization shall develop and implement SOPs, approved by the QAM and/or designee, for all monitoring activities.

#### 2.7.2 Sampling Methods

EA's sampling manuals are entitled the <u>Environmental Investigations Standard Operating</u> Procedures and Quality Assurance Manual, BEHSPROC 200 - Ambient Surface Water Sampling,

BEHSPROC 201- Field Temperature Measurement in Surface Water, BEHSPROC 202 - Field Dissolved Oxygen Measurement in Surface Water, BEHSPROC 203 - Field pH Measurement in Surface Water, BEHSPROC 204 - Field Specific Conductance Measurement in Surface Water, and BEHSPROC 205 - Multi-Parameter Field Measurements in Surface Water. These documents are reviewed periodically and updated as needed. However, staff can choose to update more frequently if changes in regulation or methodology require it. The manuals describe in detail the field sampling procedures by matrix, field instrument calibration and maintenance procedures, sample chain-of-custody documentation, sample preservation, holding times and recommended sample containers specifications, data sheet examples, and data submission requirements. These manuals are mainly internal documents. Upon request, specific sections of the Environmental Investigations Standard Operating Procedures and Quality Assurance Manual or documents may be released to external parties with the approval of the EA QAM. The BEHS procedures may be released with the approval of the BEHS Assistant Bureau Chief.

# 2.7.3 Training

An intranet training program has been established to ensure staff have access to the most recent revision of the field SOPs and have acknowledged they are familiar with the SOP content for specific assigned duties. Each program area will ensure that all personnel performing tasks and functions related to data quality will have the needed education, training, and experience. Training is tracked through the MySCLearning system. A review of basic training requirements for field staff is found in Section 4 of the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual, and in BEHSPROC 200 - Ambient Surface Water Sampling, BEHSPROC 201- Field Temperature Measurement in Surface Water, BEHSPROC 203 - Field pH Measurement in Surface Water, BEHSPROC 204 - Field Specific Conductance Measurement in Surface Water, and BEHSPROC 205 - Multi-Parameter Field Measurements in Surface Water.

The training of laboratory personnel is discussed in the most current revision of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories, Volume 1, SOP III, Personnel Training and Laboratory Procedures Manual for Environmental Microbiology -- ARESD, SOP III, Staff Training. These SOPs incorporate forms for acknowledgement that the analyst has read the method, as well as tracking forms for other various types of training. This information is kept on file at the Analytical and Radiological Environmental Services Division or appropriate Regional Laboratory. Each analyst is required to show proficiency in the analysis prior to analyzing samples. Training and documentation of proficiency are kept on file in the appropriate laboratory.

## 2.7.4 DHEC QA Policy

It is the practice of Environmental Affairs (EA) that necessary quality assurance (QA) activities be conducted within the State of South Carolina to demonstrate that all environmental data generated, processed, or used will be scientifically valid, technically defensible, and of known and acceptable precision and accuracy. It is also critical that all reported data include documented precision and accuracy and be complete, representative, and comparable. The quality of all data generated shall meet or exceed all EA and EPA program requirements.

#### 2.7.5 Documents and Records

The following list of documents and records are maintained and stored per Monitoring Strategy requirements.

# Bound Field Logbooks/Workbooks

In these logbooks are recorded all of the routine daily meter calibration results, remarks and notes relating to all activities, and values for all field measured parameters as well as time, date, station location, and collector identification information associated with all sampling activities. This logbook format provides a legally admissible document for any court supervised compliance/enforcement proceedings.

- Chain of Custody Information
- Sample Request Sheets/Data
- EPA STORET Data
- Special Study QAPPs/Data
- Analytical Workbooks/Sample Results
- Technical Reports
- QA Assessment Reports (Lab and Field)

## 2.7.6 Quality Assurance Assessment

Audits are the principal means in this Agency's QA Program to determine compliance with established QA protocols and guidelines. A complete discussion of these audits can be found in Section 3 of the most current revision of SCDHEC's <u>Environmental Investigations Standard Operating Procedures and Quality Assurance Manual</u>. The following audits are conducted by the Quality Assurance Manager (QAM) and/or designee:

- Performance Audits
- Data Quality Audits
- System Audits

In addition, the Office of Environmental Laboratory Certification performs a certification audit on EA regional laboratories (both field and stationary laboratories) at least every 3 years under both the CWA and SDWA.

#### 2.7.6.1 Water Quality Monitoring Program Assessment

To accomplish the QA objectives cited above, the Aquatic Science Programs and Water Pollution Compliance Section have developed and instituted QAM- approved field study procedures and documentation, data review, and routine EPA operating overview. Some specifics of these Sections' QA/QC activities include:

• Submission of all Quality Assurance Project Plans (QAPPs) to the QAM and/or designee for review and approval prior to implementation. Submission of work plans as requested by the

- QAM. The project manager can also request reviews of work plans to ensure QA/QC requirements are addressed completely and correctly.
- Regular reviews and updates of SCDHEC's <u>Environmental Investigations Standard Operating Procedures and Quality Assurance Manual</u> (SOP) and <u>Procedures Manual for Stream and Wastewater Facility Flow Measurement.</u>
- At least once yearly all water quality monitoring personnel are accompanied on sample collection activities by the Aquatic Science Programs' quality assurance officer for evaluation of adherence to standard operating procedures (SOP) for QA/QC.
- Water Pollution Compliance Section program staff routinely accompany facility compliance monitoring personnel to ensure adherence to standard operating procedures (SOP) during sample collection activities for QA/QC.
- All SC DHEC EA laboratories in the State are expected to participate in Proficiency Testing annually as a requirement for their Certification.
- Field staff are also required to participate in either analyzing blind QC samples or PT samples if they perform field analysis for residual chlorine, conductivity and/or pH.
- Approximately every three years, EPA Region 4 Office conducts an on-site routine audit of the Analytical and Radiological Environmental Services Division (ARESD), the Central Laboratory in Columbia and also reviews the Laboratory SOPs. EPA also conducts an on-site audit of all regional laboratories certified for drinking water microbiological parameters each cycle. Approximately every three years the Office of Environmental Laboratory Certification performs an on-site audit that covers both drinking water and wastewater.
- Internal assessments are also performed on ARESD Laboratories. These are conducted by the Quality Assurance Assistants for the EA Central laboratory via the peer review process; but these are not certifying audits. They are designed as an internal look at lab procedures and processes. EPA Region 4 is the certifying authority over the ARESD Laboratories.

#### 2.7.7 Corrective Actions/Quality Improvement

Identifying quality problems and improving performance are key components in our quality improvement efforts. The QAM is responsible for responding to and resolving all quality assurance problems and needs. The QAM will initiate corrective action to adverse conditions that compromise quality in the field or laboratory. Corrective actions may originate from audit findings or problems encountered and reported to the QAM or Program Manager. Staff are expected to initiate corrective actions immediately to resolve QA issues and concerns, to document corrective action and the results of the corrective action. Laboratories that fail Proficiency Studies must submit a letter to the Office of Environmental Laboratory Certification explaining the reason for the failure and the correction action taken. Central/Regional Office Monitoring Program Managers and Laboratory Managers are responsible for making sure corrective actions have been implemented, were effective, and reported to the appropriate

Program manager, Project manager, Quality Assurance Assistants (QAAs), and/or the QAM.

# 2.8 Laboratory Support

The Analytical and Radiological Environmental Services Division (ARESD) in the Bureau of Environmental Health Services (BEHS) provides laboratory services to the Bureaus of Water, Land and Waste Management, Bureau of Air Quality, and the Milk and Dairy Program. The analytical services offered include bacteriological, chemical, ambient air monitoring, and physical analyses. The types of samples analyzed include water, wastewater, leachate, soil, sediment, chemical waste, fish, shellfish, ambient air, and milk/dairy products.

The BEHS organizational structure encompasses the Central Laboratory (ARESD), seven regional laboratories (each of these regional labs also has a field lab), and five additional field labs. ARESD, also known as the Central Laboratory includes the following laboratories: Microbiology and Milk/Dairy, Inorganic Chemistry, Organic Chemistry, Radiochemistry and the Sample and Data Management Section. The Central Laboratory also has an air toxics laboratory which performs ambient air monitoring and includes a field element which is the larger focus of the ambient air monitoring network. These areas are located in the Hayne Building in Columbia. The seven regional laboratories are located in Aiken, Beaufort, North Charleston, Florence, Greenville, Lancaster, and Myrtle Beach. Other field labs which only collect samples and perform field analyses (pH, conductivity, temperature, residual chlorine, and dissolved oxygen) are located in Anderson, Greenwood, Spartanburg, Columbia, Orangeburg, and Sumter. The Columbia facility is separate from ARESD but collects samples for this lab. ARESD, in turn, performs similar functions as the other regional laboratories for the Columbia facility.

The field laboratories initiate all stream and wastewater analysis. The Central Laboratory provides support analyses, i.e., metals, nutrient, extraction procedures, and organic analyses. The Beaufort and Myrtle Beach regional laboratories analyze microbiological samples only. Drinking water chemical analysis is essentially a Central Laboratory program with support from the regional labs. All regional laboratories perform microbiological analyses for the Drinking Water Program.

#### 2.8.2 ARESD Quality Assurance Program

The Assistant Bureau Chief (ABC) of the BEHS Laboratories along with the Division Director of ARESD, and the QAAs coordinate the internal ARESD quality assurance program. The laboratory quality assurance program encompasses every aspect of the laboratory analysis from container preparation through the actual data release from ARESD to the Environmental Affairs' Programs.

2.8.2.1 ARESD has four quality control manuals which detail the day-to-day operation of the quality assurance program: (1) Procedures and Quality Control Manual for Chemistry Laboratories - ARESD, (2) Laboratory Procedures Manual for Environmental Microbiology -- ARESD, (3) Procedures and Quality Control Manual For the Radiochemistry Laboratory -- ARESD, and (4) Standard Operating Procedures for Milk and Dairy -- ARESD. The elements addressed in the manuals include organization; sample chain of custody; personnel training; quality control of laboratory services, scope and application, equipment and supplies, reagents, standards, methodology, preservation and storage, calibration, performance criteria and quality assurance, and

waste management.

2.8.2.2 The overall laboratory quality assurance program contains many elements, some of which have been previously discussed. The frequency for analysis of replicates and spike recovery samples is noted in the manuals and is in compliance with U.S. EPA guidelines. Acceptance criteria for each QC check is detailed in each procedure of the SOP Manual. The Environmental Microbiology Laboratories perform replicate analyses, positive test controls, media control tests, equipment control tests, etc., as required by EPA Laboratory Certification and Evaluation guidelines. In addition, ARESD and the regional laboratories participate in annual Water Supply and Water Pollution Proficiency Testing Programs. All regional personnel who collect samples that require field testing participate in either the yearly Water Supply or Water Pollution Proficiency Testing Program, whichever is appropriate. Occasionally, field or other non-laboratory staff may assist the Microbiologist in setting up samples or reading them. Anyone participating in this way must demonstrate proficiency in any activity they will perform. Their proficiency is assessed through use of a blind sample obtained from either a QC Sample Vendor or made in-house. This proficiency is documented and kept in the Regional Office.

2.8.2.3 The laboratory analyses for water quality monitoring are conducted according to 40 CFR Parts 141, 136, and 143. The ARESD quality control manuals include a section on methodology designed to reduce variations in applied techniques among the State laboratories where methods permit analyst interpretation, and thus provide a more uniform approach which will increase the reproducibility of results reported from the laboratory system. Analytical SOPs are identified by number and date of revision. Each SOP includes the approved method reference. SOPs are reviewed annually.

SOPs include instrument calibration and maintenance procedures as well as corrective actions for any deficiencies or problems encountered.

## 2.8.3 Sample Containers and Preservation

2.8.3.1 Control of the quality of laboratory analyses begins with the sample collection. The validity of analytical results obtained depends upon a representative sample of the source from which it was collected. The concentration of each constituent in a sample at the time of collection must be maintained until all analyses have been completed. Constituent concentrations may be altered after collection through contamination of the container, reactions between sample components and the container walls, and through naturally occurring reactions within the sample itself. This section contains the methodology employed by the laboratories to control those factors which can affect sample validity. The field sample collection procedures, standard operating procedures, and QC procedures are documented in the most current revision of SCDHEC's BEHSPROC 108.

2.8.3.2 The proper containers must be selected for sampling as well as the proper preservation and an adequate volume collected. Sample chain of custody procedures must be adhered to in order to ensure that sample integrity is maintained. An accurate record is needed to trace the possession of each sample from the time of collection to analysis. The reader should refer to the most current revision of SCDHEC's manual entitled <a href="Environmental Quality Control Environmental Investigations Standard Operating Procedures and Quality Assurance Manual">Manual</a>, Section 19 and Appendix A for

details.

Glass, polyethylene, and polypropylene bottles are used as sample containers. The sample container is cleaned and labeled for the parameter for which it is used. The containers used for the various parameters have been chosen for their chemical resistance to the chemical parameter of interest and the required preservatives. Random substitution of containers may not be made.

Special cleaning procedures are employed for the various containers. Each parameter or parameter group involves different interfering compounds and contaminants which must be removed from the container walls. The laboratories maintain a supply of the required containers. Clean containers for organic and inorganic parameters are shipped to the field laboratories by the Data Management Section in Columbia. Containers required for parameters analyzed by the field laboratories are maintained by those laboratories and cleaned according to special procedures.

2.8.3.3 All ambient water and wastewater samples are preserved at the site immediately after collection or collected in pre-preserved containers. Some drinking water samples are preserved at the site, collected in pre-preserved containers or may be preserved after they have been brought back to the office or the lab in accordance with requirements established by the United States Environmental Protection Agency.

The field laboratories are responsible for requesting the preservatives in order to maintain an ample quantity; and the central and regional laboratories provide the supplies upon request. Each dispenser is labeled in bold letters to assist the collector to choose the proper preservative for the container; i.e., METALS, MERCURY, NUTRIENTS, TOC, etc. Because the concentration levels cannot be maintained at the level collected indefinitely, maximum holding times have been set for each parameter. Analyses must be completed during the time limits set for valid results. Required containers, preservatives, and holding times for each parameter and procedures used for preserving samples are listed in the most current revisions of manuals listed in Section 2.8.2.1, Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (Appendix A), and BEHSPROC 108 – Sample Containers, Preservation, and Maximum Holding Times for Chemistry and Microbiological Analyses.

#### 2.8.4 Laboratory Evaluation Program

The SC Environmental Laboratory Certification Program is authorized by Regulation 61-81 entitled "State Environmental Laboratory Certification Regulation" which became effective on January 1, 1981. The Regulation applies to all laboratories which generate data for compliance with state environmental regulations or that is performing any other analyses related to environmental quality evaluations required by the Department or which will be officially submitted to the Department.

On-site evaluations of in-state certified laboratories are conducted at least every three years and are scheduled approximately three months prior to the date of expiration documented on the laboratory's certification certificate. The Certification Program currently offers certification for laboratories performing analyses of drinking water, wastewater and solid and/or hazardous wastes.

## 2.9 Data Review, Verification, and Validation

The following protocols are followed for review and verification of data use in the Ambient Water Quality Monitoring Program. Data validation and decisions regarding anomalous data are made independently for different activity's data applications.

- The analyst reviews data and QC for accuracy and completeness. Data are submitted to the Lab Manager or senior level personnel for review and data verification.
- The laboratory manager reviews all sample request sheets originating in the region for correct information and sends to the Analytical and Radiological Environmental Services Division.
- The analyst, manager, Data Management staff, or designated individual enters data into LIMS. Senior level personnel or the Data Management staff verify the transcribed data for accuracy. The Lab Director or designee releases the verified data from the laboratory and sends to the appropriate program area.
- When a particular sample fails any portion of the laboratory QC procedures, the data is flagged in the LIMS according to Section IV-G of the most current revision of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories --ARESD and Section IV-E of the Laboratory Procedures Manual for Environmental Microbiology -- ARESD. The data is not reportable if the Laboratory Fortified Blank (LFB) is unacceptable. If the surrogate recovery or laboratory matrix spike are out-ofcontrol limits, this may be due to a matrix effect and the data still may be considered valid and reportable (with data flags) after all procedural requirements such as repeating the analysis or sample preparation have been exhausted. The program can request that data be released to them for information purposes only in some instances, e.g. if holding times were exceeded because samples did not arrive in the lab to be analyzed in a timely manner. The data notes would state that samples exceeded holding time but were analyzed at the program's request. However, any program request for data for informational purposes only must be made in writing documenting the limited use for non-regulatory purposes. This request should be made to the Division Director of ARESD.
- Upon analysis completion and verification a percentage of the data is validated. After validation, data are released by the laboratory and sent to the specific program areas responsible for the original samples for final QA review.
- As part of an on-site audit, a peer review process performs an internal assessment which traces the data from the collection activities, through the analytical methodology, and to the final report.

## 2.9.1 Reconciliation with Program Specific Data Quality Objectives

The Bureau of Water's Division of Water Quality Management, Assessment and Protection is

responsible for final review and reporting of all monitoring results to EPA and other end users.

For continuous monitoring data, all raw data are maintained separately from any post-processing data correction/adjustment files created. Once data adjustments are applied, then each recorded data point is compared to the original, unadjusted record. It is assigned an accuracy rating according to the table in Section 15.3 of Standard Operating Procedure for Continuous Monitoring of Ambient Surface Water, Attachment 1. If any part of a continuous data segment exceeds the Rejection criteria it is eliminated from further analysis, subject to project data quality objectives, but will be used for informational purposes.

Any limitations of data use will be conveyed in reports sent.

C. Ambient Surface Water Quality Monitoring Sites Listed by Regions Showi Individual Parameter Coverage	ing

## **Key to Abbreviations**

## Column Headings

STATION NUMBER = Station Identification Number

TEMP = Water Temperature

DO = Dissolved Oxygen

Hq = Hq

PROFILE MAY-OCT = Profile field parameters, months of May through October

TIDE STAGE = Tide Stage

COND = Specific Conductance (Conductivity)

SALT = Salinity

TURB = Turbidity

ALKL = Alkalinity

BOD<sub>5</sub> = Five-Day Biochemical Oxygen Demand

NH<sub>3</sub> NH<sub>4</sub> = Ammonia Nitrogen

NO<sub>2</sub> NO<sub>3</sub> = Nitrite & Nitrate Nitrogen

TKN = Total Kjeldahl Nitrogen

TP = Total Phosphorus as Phosphate

E. COLI = Escherichia coli Bacteria

ENTERO = Enterococcus Bacteria

TSS = Total Suspended Solids

HARD = Hardness

METALS = Select Heavy Metals (see Appendix D for list)

LEAD ONLY = Sample only analyzed for lead, no other metals

MERC = Mercury

CHL-A = Chlorophyll-a, moths of May through October

SECH = Transparency (Secchi depth)

# <u>Sampling Frequency</u> (See Section 2.1 Ambient Surface Water Physical & Chemical Monitoring for further details)

M = Monthly (for Chlorophyll-a and field parameter profiles, months of May through October only)

Q = Quarterly

A = Annually

#### 2.0 SCOPE AND APPLICATION

This method is for the use of multiparameter data sondes for unattended measurements of water quality parameters (i.e. temperature, conductivity, salinity, pH, dissolved oxygen, chlorophyll-a, and turbidity) in ambient surface water.

#### 3.0 SUMMARY OF METHOD

A multiparameter data sonde contains several water quality sensors. Each sensor is calibrated and validated prior to sonde deployment. At the end of each deployment, the data sonde is returned to the lab for data download, sensor verification, cleaning, and inspection and maintenance. Calibration and fouling drift corrections are presented along with quality control criteria for accepting or rejecting continuous monitoring data and data reporting requirements. This method is based on the USGS guidelines for continuous monitoring of water quality<sup>1</sup>.

#### 4.0 **DEFINITIONS**

Ambient Surface Water – a surface water body that is outside of defined National Pollutant Discharge Elimination System (NPDES) discharge zones and when the project's objective is not compliance monitoring.

Continuous Monitoring – the unattended measurement of one or more water quality parameters over periods of time from several hours to several weeks.

Data sonde or Sonde – a field monitoring device that includes a water quality sensor array and internal data storage capabilities.

Sensor Guard – a weighted cap with holes used during deployment to help keep the data sonde vertical and to protect the sensors while allowing the free exchange of water over the sensors.

Batch, Record, or Deployment – a series of measurements performed with a single calibration of the instrument.

Quality Assurance Project Plan (QAPP) – guidance document for work performed detailing the field and lab materials and methods, time frame, and quality assurance methods for a project.

#### 5.0 INTERFERENCES

Data obtained by water quality instruments deployed over extended periods of time are subject to both calibration and fouling drift. Calibration drift is inherent to all electrical measurement devices. Fouling drift occurs during long-term deployments when the sensor's measurement surfaces are coated with a build-up of sediment and/or organic matter which affects the accuracy of the measurements.

#### 6.0 PRE-DEPLOYMENT CONSIDERATIONS

- 6.1 Deployment lengths for routine monitoring are typically 2 weeks. The deployment period for a special study varies depending upon the study objectives and are detailed in the QAPP.
- 6.2 Continuous monitoring sites are also typically grab sample locations.

  Considerations for sample site selection vary with water body type (river/stream, lake, estuary/coastal water) and include:
  - 6.2.1 Study objectives
  - 6.2.2 Data quality objectives
  - 6.2.3 Tributary locations (rivers/streams, or lakes)
  - 6.2.4 Changes in bed characteristics
  - 6.2.5 Location of saltwater/fresh water boundary and the range and period of the tide in estuarine and coastal systems
  - 6.2.6 Turbulence
  - 6.2.7 Location of man-made structures

Further details are available in the most recent version of Chapter 7 of the Bureau of Environmental Health Services SOP & Safety Manual: Wastewater Facility and Ambient Monitoring.

- 6.3 Continuous monitoring measurements are typically made at either the same depth below the surface of the water or above the bottom. Therefore, mounting a data sonde to a floating dock or within a moored oceanographic buoy is preferred. Specific deployment depths are addressed in the QAPP.
- 6.4 Reconnaissance of the study area is required to determine appropriate sample locations. When using a floating dock, determine the location of a dock or docks closest to the preferred sampling station. This frequently means contacting private homeowners and obtaining their permission to use their dock. When deploying a data sonde using an oceanographic buoy, permission must be obtained from the U.S. Coast Guard ATON office in Miami, Florida and the Army Corps of Engineers in the respective district. Both entities will require application forms to be completed including maps and latitude/longitude positions of the planned deployment locations. Decisions on deployment locations should be made at least 2 months prior to any planned continuous monitoring deployment so that appropriate permissions may be obtained and alternative sites selected as needed.
- 6.5 Steps should be taken to minimize biofouling of the sonde to the extent possible. Copper is a known anti-fouling agent and can be purchased as a roll of tape or copper mesh, for example, and applied to the outside of each sensor as well as used to cover the sensor guard. Detailed instructions for the use of copper tape or mesh are available from the manufacturer of the specific sonde used.

#### 7.0 HEALTH AND SAFETY

A reference file of SDS sheets appropriate to the standards used when calibrating the data sondes is available in the Sims-Aycock Annex Building Room 105A as well as online at G:\COMMON\_ANNEX\ANNEX Safety\Laboratory Safety.

#### 8.0 EQUIPMENT AND SUPPLIES

- 8.1 Multiparameter data sondes (e.g. Hydrolab DS5x)
- 8.2 Computer or handheld display unit device (e.g. Hydrolab Surveyor 4a)
- 8.3 Calibration and field data cable
- 8.4 Continuous data logbook
- 8.5 Field logbook
- 8.6 Labeling tape
- 8.7 Permanent markers
- 8.8 Weighted sensor guard
- 8.9 500 to 1,000 mL polypropylene bottle filled with tap water
- 8.10 Sonde repair kit containing spare parts and tools

#### 9.0 REAGENTS AND STANDARDS

Reagents and Standards used during data sonde calibration and verification are listed in the sonde-specific SOP.

#### 10.0 SAMPLE COLLECTION, PRESERVATION, AND STORAGE

Not applicable: This SOP covers in-situ continuous monitoring of water quality measurements.

### 11.0 PERFORMANCE CRITERIA AND QUALITY ASSURANCE

- 11.1 Initial Demonstration of Capability (IDC): A new employee must be trained on the use of the multiparameter probes by more experienced personnel and then demonstrate proficiency by working through the calibration, validation, and verification steps successfully as detailed in the individual SOPs.
- 11.2 Precision Control: measurement precision for in-situ water quality instruments is accommodated during the measurement stabilization time period. Prior to recording the sensor readings, those readings must be allowed to stabilize to a median value ± 10% of the median observed.
- 11.3 Accuracy Checks: Linear calibrations are performed on each of the sonde's probes prior to deployment according to the manufacturer's instructions<sup>2</sup>.

  Calibration validation checks are performed for LDO, pH, and Conductivity.

  Temperature is factory calibrated and needs to be checked once each year using a NIST traceable thermometer. Verification checks are performed within 24 hours

of return of the sonde to the lab to check for fouling or instrument calibration drift. Calibration, validation, and verification criteria are listed in the table in Section 15.1.

11.4 Failure to meet these criteria during instrument calibration and validation requires that the calibration be performed again and possibly new standards made. A sonde that repeatedly fails calibration is not deployed and is sent to the manufacturer for testing and repair. Post deployment verification is performed prior to cleaning the sonde. If the verification fails the first time, the sonde is cleaned and the verification is performed again. If the sonde fails to verify after cleaning, then post processing of the data for Total Error is performed according to the USGS guidelines<sup>1</sup>. If the sonde verifies after cleaning, then the post processing of the data for Fouling Error is performed according to the USGS guidelines<sup>1</sup>. Adjusted data may still be used for model development. Post processing steps and evaluation criteria are outlined in Sections 13 and 15.

### 12.0 PROCEDURE

NOTE: Detailed instructions for the pre-deployment calibration and validation, programming, in-situ depth calibration, and post-deployment verification of a specific data sonde are available in the SOP and User's Manual for that sonde (e.g. Hydrolab DS5X, YSI EXO2).

#### 12.1 Calibration

Continuous monitoring may involve deploying several sondes simultaneously. In order to accommodate calibration, validation, programming, transportation, and deployment times, data sondes are calibrated within 48 hours prior of the beginning of each deployment rather than at start of day.

#### 12.2 Programming for Deployment

At the end of the calibration process, each sonde is programmed to autonomously measure several water quality parameters simultaneously. The data sonde will need to be programmed with the following information:

- 12.2.1 The start date/time and end date/time for the deployment. The start date/time is set so that the sonde begins recording during the morning of the deployment day. The length of time programmed should exceed the anticipated length of the deployment of the sonde. For example, set the start and end date/time to be 4 weeks apart for a planned deployment of 2 weeks. This ensures that data will continue to be collected if weather or other circumstances delay the retrieval of the sonde.
- 12.2.2 Sampling interval (dependent upon deployment environment and study requirements). The sampling interval is the frequency with which the data sonde records the water quality measurements to its internal memory. The sampling interval for routine ambient monitoring is 15 minutes. The

- sampling interval for Special Studies varies depending on the objective of the study and is described in the QAPP.
- 12.2.3 The selection of water quality parameters to be measured. This selection will depend on the requirements of the study and the sensors available in the data sonde.
- 12.2.4 Logbook Record. The written record for the deployment of each sonde should include the filename (internal sonde data file), continuous monitoring Station ID, sample interval, program duration (start/stop), and anticipated deployment length. The format for the file name should be the alphanumeric Station ID followed by the 4-digit year, 2-digit month, and 2-digit day (AA-NN-YYYY-MM-DD).

#### 12.3 In the Field

- 12.3.1 Calibrate depth on the data sonde just prior to placing it in the deployment tube or buoy cage.
- 12.3.2 Secure the sonde in the dock deployment tube or buoy cage and record the deployment date and time in the Field Logbook. Also, record the retrieval date and time of any sonde removed from that location.
- 12.3.3 For each continuous monitoring station visited, begin the steps again from 11.3.1.
- 12.3.4 A mid-deployment inspection of the sonde and download and review of the data can reveal instrument failure, power loss, and other mechanical problems. At that time, batteries may be replaced and any needed repairs may be made in the field. A mid-deployment verification is conducted at this time (Section 12.4.1). Read the data from both sondes and record them in the field logbook.

#### 12.4 Verification

Continuous monitoring sonde verification occurs more than once. The first verification occurs in the field at roughly the mid-point of the deployment. NOTE: for deployments longer than 2 weeks, this field verification may occur more than once. The second verification occurs when the sonde is returned to the lab at the end of its deployment.

SC DHEC considers data from a single deployment in segments: 1) from initial deployment to field verification, 2) from field to end-of-deployment verification, and 3) between field verifications (if needed).

- 12.4.1 The field verification is a comparison of the current continuous monitoring sonde readings with those of an identical instrument, calibrated that morning, used to collect instantaneous water quality readings at that site.
  - 12.4.1.1 If the variance between the continuous monitoring and the instantaneous sonde readings (Section 13.3) are within the calibration criteria (Section 15.1), field personnel record that calculation result in the field logbook and leave the continuous monitoring sonde at its deployment location until the next field verification or the end of its planned deployment.
  - 12.4.1.2 If the variance for pH, dissolved oxygen, or conductivity exceed the calibration criteria, then the deployed sonde is pulled from its location. A freshly calibrated spare sonde will be deployed if one is available at that time.
  - 12.4.1.3 If the variance for turbidity or chlorophyll *a* exceed the calibration criteria, but the variance for pH, dissolved oxygen, and conductivity are all within the calibration criteria, it is up to the discretion of the field personnel whether or not to retrieve and replace the sonde at that location.
  - 12.4.1.4 The instantaneous water quality sonde is verified in the lab at the end of the day. Verification failure is noted and the variance information used during post-processing of Segment 1 data (Section 12.4).
- 12.4.2 Post-deployment verification of the data sondes must be performed within 24 hours of returning the instrument to the laboratory. This pertains to sondes that were retrieved mid-deployment as well as those retrieved at the end of a planned deployment. The verification is first performed prior to cleaning the data sondes. If the verification values fall within the criteria listed in the table in Section 15.1, then no data adjustments will be made, and the data sondes cleaned and stored to be ready for the next deployment.
- 12.4.3 If any of the pre-cleaned verification values fall outside of the stated criteria, then the data sondes will be cleaned, and the verification process performed a second time for any sensors that did not meet the verification criteria. If the post-cleaning verification data falls within acceptable data tolerances, then the data will be adjusted linearly for fouling error as a percent. If the post cleaning verification data falls outside of the acceptable data tolerances, then the data will be adjusted linearly for total error as a percent (see Section 13.0).

#### 12.5 Data Retrieval

12.5.1 Once the sonde verification process is complete, stop the current program and transfer the data file stored on the sonde to the common computer drive (G:\COMMON ANNEX...). Always make sure that the data file

was transferred successfully to the common drive prior to deleting the file from the sonde. This raw data is maintained separately from any postprocessing files that are created according to Section 13.0.

### 13.0 CALCULATIONS, DATA REPORTING, AND QUALITY CONTROL

- 13.1 The data sonde firmware calculates salinity from temperature and conductivity and makes any needed temperature adjustments to DO readings. Notification of updated firmware is pushed to the end-users by the manufacturer and is installed to the data sondes by SC DHEC personnel.
- 13.2 Results are reported as follows. The number of significant digits is dictated by the sensor precision of each measurement. Please see the data sonde-specific SOP.
  - 13.2.1 Temperature °C
  - 13.2.2 Conductivity –μS/cm
  - 13.2.3 Salinity PPT (estuarine and salt water systems only)
  - 13.2.4 pH Standard Units
  - 13.2.5 LDO mg/L
  - 13.2.6 Chlorophyll  $a \mu g/L$
  - 13.2.7 Turbidity NTU
- 13.3 The variance for the calibration and verification criteria is calculated as either a percent (specific conductance, turbidity, and chlorophyll *a*):

$$\text{%Variance} = [(\text{Measured Value/Standard Value}) - 1] \times 100$$
 (Eq. 1)

or as the difference between the stated standard value and the current sonde measurement. For the mid-deployment verification, the instantaneous measurement sonde reading is used in place of the standard value.

13.4 Error propagation is performed on any final calculated quantity reported. The method used depends on the calculation. For sums and differences, the final error reported is the square root of the sum of the squares:

$$R \pm \delta R = (A \pm a) + (B \pm b) + \dots + (I \pm i)$$
 (Eq. 2)

$$\delta R = \sqrt{a^2 + b^2 + \dots + i^2} \tag{Eq. 3}$$

Where R is the sum (or difference),  $\delta R$  is the propagated error value, and  $A \pm a$  etc. is each measurement with its associated measurement error.

Mean values are calculated as:

$$\bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i \tag{Eq. 4}$$

and

$$\bar{x} \pm \delta R$$
 (Eq. 5)

where  $\bar{x}$  is the mean and  $\delta R$  is calculated from the individual measurement error as shown above.

13.5 Initial post processing of the data is conducted according to a modification of the USGS Guidelines for Continuous Monitoring<sup>2</sup>. If the end-of-deployment verification exceeds the calibration criteria listed in Table 15.1, it is processed as described in Sections 13.5.1 to 13.5.5.

#### 13.5.1 Initial Data Evaluation

Verify the accurate transfer of raw field data from the data sonde to a folder on the shared drive (G:\COMMON\_ANNEX\...) named for the year in which the data was collected. Evaluate and identify erroneous data.

#### 13.5.2 Removal of Erroneous Data

NOTE: Complete mechanical failure of a sensor or the sonde while deployed is obvious when examining the stored data (see example in Section 15.2). This data is not capable of being post processed and is, therefore, excluded from further review.

#### 13.5.3 Error Calculations

For continuous monitoring data sondes, total error  $(E_T)$  is the combination of sensor fouling error  $(E_f)$  plus calibration drift error  $(E_c)$ .

$$E_T = E_f + E_c \tag{Eq. 6}$$

Total error is equivalent to variance (Section 13.3), but is broken into its component parts in order to assess whether more rigorous fouling control measures are needed or whether instrument repair is needed.

Biofouling errors are calculated as:

$$E_f = M_c - M_f \tag{Eq. 7}$$

where  $M_c$  is the value measured after the data sonde has been cleaned and  $M_f$  is the value measured prior to cleaning at the end of a deployment period. The calibration drift error  $(E_c)$  is calculated as the value of the standard solution  $(V_s)$  minus the post-deployment, clean sensor reading of the standard solution  $(M_c$  as in Eq. 7) obtained during the verification process:

$$E_c = V_s - M_c \tag{Eq. 8}$$

Post deployment verification begins prior to cleaning the data sondes. If the verification values fall within the tolerances listed in Section 15.1, then no data adjustments will be made, and the data sondes cleaned and calibrated again prior to the next deployment. However, if the pre-cleaned verification values fall outside of the stated criteria, then the data sondes will be cleaned immediately, and the data verification performed a second time. If the post-cleaning verification data falls within acceptable data tolerances, then the data will be adjusted linearly for fouling error as a percent.

$$\%E_f = 100 \times \left(\frac{M_c - M_f}{M_f}\right) \tag{Eq. 9}$$

If the post-cleaning verification data do not meet acceptable data tolerances, then the data will also be adjusted linearly for calibration drift error as a percent.

$$\%E_c = 100 \times \left(\frac{V_s - M_c}{M_c}\right)$$
 (Eq. 10)

In this case, the fouling error  $(E_f)$  is calculated as the difference between the total error  $(E_T)$  and the calibration drift error  $(E_c)$ , with the total error calculated as the difference between the pre-cleaned verification value and the value of the standard solution. Total error is the variance found during the end-of-deployment verification process.

# 13.5.4 Data Adjustment, Accuracy Ratings, and Adjustment Limits If post-deployment verification results exceed the stated calibration criteria, then Data Correction is applied.

A linear equation (y = mx + b) is developed between the two points consisting of the date and time of calibration and verification (x-values) and the ratios of the stated standard values to the sensor readings at that time (y-values). NOTE: the successful calibration ratio is assumed to be 1, the verification ratio may be greater than or less than 1. The linear equation is then applied to the data segment of interest with "x" being the date/time stamp during the deployment and the resulting "y" value the ratio as it changes through time. The resulting "y" value for each date/time stamp of the segment is then applied to the raw sensor data to create the adjusted column of data.

Once data adjustments are applied, then each recorded data point is compared to the original, unadjusted record. It is assigned an accuracy rating according to the table in Section 15.3. If any part of the data

segment exceeds the Rejection criteria, that segment is eliminated from further analysis but will be used for informational purposes.

13.5.5 Data will then be analyzed using descriptive statistics, boxplots, and outlier tests to determine whether any additional data points should be removed from further analysis<sup>3</sup>.

### 14.0 WASTE MANAGEMENT

Not applicable to this SOP. Waste management of the reagents and Standards used in the calibration of individual sensors is detailed in the SOP for each sensor.

### 15.0 TABLES, DIAGRAMS, FLOWCHARTS

### 15.1 Calibration, Validation, and Verification Criteria

Parameter	USGS Calibration Verification Criteria (Wagner et al., 2006)	BOW Calibration Verification Criteria
Temperature	± 0.2 °C	Verify with NIST thermometer at least once during field season. ± 0.1 °C
Specific Conductance	± 5 μS/cm or ±3 % of the measured value, whichever is greater	±10%
Dissolved oxygen	± 0.3 mg/L	± 0.2 mg/L
pН	± 0.2 pH unit	± 0.2 unit
Turbidity	± 0.5 NTU or ± 5% of the measured value, whichever is greater	± 10%
Chlorophyll a	None	± 10%

### 15.2 Erroneous Sonde Data Example

Continuous monitoring Turbidity data from within the same field area. The record from Station BB-04 site is the result of turbidity sensor failure during deployment and is typical of obviously erroneous data. Please note the extreme difference in Turbidity scales between the primary and secondary vertical axes as well as the flat shape of the BB-04 profile across the top highlighted by the red circle.

15.3 Data Accuracy Ratings and Maximum Allowable Data Adjustments

Parameter	Excellent	Good	Fair	Adjustment Rejection Limit
Specific Conductance (%)	₹∓ 10%	$> \pm 10\%$ to $\leq \pm 15\%$	$> \pm 15\%$ to $< \pm 20\%$	≥ ± 20%
Dissolved Oxygen (mg/L)	≤± 0.2 mg/L	$> \pm 0.2$ to $\leq \pm 0.8$ mg/L $> \pm 0.8$ to $< \pm 1.5$ mg/L	$> \pm 0.8$ to $< \pm 1.5$ mg/L	≥± 1.5 mg/L
pH (Standard Unit)	≤± 0.2 Unit	$>\pm 0.2$ to $\leq\pm 0.6$ Unit	$> \pm 0.6$ to $< \pm 1.0$ Unit	≥ ± 1.0 Unit
Turbidity (%)	<= 10%	$> \pm 10\%$ to $\leq \pm 15\%$	$> \pm 15\%$ to $< \pm 20\%$	> ± 20%
Chlorophyll a (%)	<= 10%	$> \pm 10\%$ to $\leq \pm 15\%$	$> \pm 15\%$ to $< \pm 20\%$	> ± 20%

#### 3.0 SPECIAL MONITORING AND COMPLIANCE MONITORING

#### 3.1 Intensive Surveys and Special Water Quality Studies

Special studies provide immediate and in-depth investigations targeting specific environmental problems or involve practical research that leads to a better understanding of the water quality of the State of South Carolina. The data collected are summarized and reported at the conclusion of each study.

Special water quality studies are conducted as needed to determine cause and effect relationships in waterbodies where trend monitoring indicates a deterioration in environmental quality. They provide legally defensible data on damage in situations where compliance monitoring indicates violation of permits and/or water quality standards. Special water quality assessments most often target waterbodies listed on the §303(d) list of impaired waters not meeting designated uses or are requested for waterbodies having high or potentially high public water use values.

There is usually a specific need or problem identified in the initial study request, such as the pollutant or biological condition resulting in a §303(d) listing. When selecting indicators for a special study, conditions that may cause or contribute to nonattainment of applicable WQS are considered. It is important to consider the potential cumulative impacts to a waterbody resulting from multiple sources of pollutants. For example, are there sources in the watershed that separately or collectively might contribute pollutants in amounts or combinations that could cause an exceedance of a water quality criterion, create toxic conditions, or accumulate in fish tissue? Principal considerations include point sources, nonpoint sources, geology/hydrology, and land-use patterns, both current and historic, and suspected pervasive pollutants that may be transported by atmospheric processes.

Point sources in the watershed may contribute pollutants that cause or contribute to nonattainment of WQS. Information about the type of facility and nature of discharges can help identify potential pollutants. Point sources may have existed historically but may no longer be active. Legacy contaminants from these sources may still be present within bed sediments in the waterbody or in soils at the site. A review of current and past permittee's NPDES permit limits and compliance history information may be included in the study design process.

Nonpoint sources generally are related to land-use practices. Land use (e.g., rural, agricultural, urban, industrial) often dictates what indicators may be most suitable for water quality monitoring. To the extent possible, current and historic land-use practices in the watershed are identified. Past land-use practices may be very different from current practices, and residual pollutants may be present in the bed sediments in the water or in soils at the site. Disturbances from land-use practices or changes in land-use may aggravate already marginal natural water quality conditions. Available information about local agriculture, pesticide usage, urban/impervious surfaces, land management practices (e.g., forestry, mining), and best management practices (BMP) that would mitigate pollutant impacts are considered.

Geologic and hydrologic processes within and upstream from a waterbody generally establish background water quality conditions within the watershed. In some cases, weathering and transport processes for certain geologic areas may result in increased concentrations of metals, particularly arsenic, cadmium, mercury, and selenium. Increased concentrations may be found both in the water column and in underlying sediments.

An investigation of specific environmental problems may originate as an official request from other staff from various sections of EA, to support decision making on a variety of issues. Studies may also be initiated in response to requests by private citizens or special interest groups. Once an official request to carry out a specific task has been received, Aquatic Science Programs staff designs, receives approval from the Quality Assurance Manager (QAM), and implements the study. The results of such studies are reported primarily to the originator of the study request.

In conducting practical research, the Aquatic Science Programs generally relies on its own staff, as well as the scientific staff of other sections of EA. The Aquatic Science Programs staff designs and implements, or coordinates such studies, if other groups are involved, and reports all findings to all interested parties.

Study plans for any special studies are submitted to the QAM for approval prior to sampling. All sampling and field analyses are performed according to the most current revisions of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual and Procedures Manual for Stream and Wastewater Facility Flow Measurement. All laboratory analyses are performed according to the most current revisions of SCDHEC's Procedures and Quality Control Manual for Chemistry Laboratories--ARESD and Laboratory Procedures Manual for Environmental Microbiology--ARESD.

Nonpoint source (NPS) monitoring includes both biological investigations and water quality assessments. Data collected is used for various purposes including: identifying waters not fully meeting designated uses due to NPS pollution, addressing waters currently listed on the §303(d) list, assisting in enforcement investigations, and assessing the effectiveness of best management practices (BMPs) in agricultural, silvicultural and residential areas.

Water quality, biological, and habitat assessments are conducted as needed in response to complaints from the public and subsequent requests from central and regional EA personnel. Results help determine the need for enforcement action.

Biological investigations typically focus on waterbodies included on the §303(d) list due to a demonstrated impairment to the biological community or excursions relative to metals, pH or dissolved oxygen (DO) levels. Sites are re-assessed for impairment and possible causes may be explored. To maximize effectiveness, these investigations are timed to complement the macroinvertebrate trend-monitoring effort.

Sites listed for impairment due to elevated *E.coli* bacteria levels are also targeted for special sampling. The accompanying effort to identify potential sources typically involves intensive sampling combined with consideration of relevant point sources, nonpoint sources, adjacent land use, and shoreline reconnaissance.

## 3.1.1 Documenting Water Quality Improvement Efforts

Section 319 of the Clean Water Act deals with the control and reduction of nonpoint source pollutants and includes the award of annual grants to states from EPA. These grant funds are primarily used to implement watershed-based plans for impaired waters. SCDHEC passes a portion of its annual 319 grant to outside groups through a competitive process to carry out the implementation of these plans. Implementation includes the installation of an array of structural and non-structural Best Management Practices (BMPs) designed to reduce or remove nonpoint source contributions within a watershed. The ultimate goal is to remove the impairment for the specific pollutant for which the plan was developed. Monitoring is a crucial component of determining the initial impairment as well as documenting potential water quality improvements resulting from such an implementation effort.

Nonpoint source (NPS) monitoring includes both biological investigations and water quality assessments. Data collected is used for various purposes including: identifying waters not fully meeting designated uses due to NPS pollution, addressing waters currently listed on the §303(d) list, assisting in enforcement investigations, and assessing the effectiveness of best management practices (BMPs) in agricultural, silvicultural and residential areas.

Because watershed-based plans are developed based on SCDHEC water quality monitoring sites, project success must also be based on data collected from those sites. SCDHEC uses 319 funds to pay for the staff and analysis costs related to this monitoring effort. Often there are sites of interest within the project areas that are not active throughout the duration of the project period as part of the Ambient Surface Water Physical & Chemical Monitoring Network. In these instances, staff in the Aquatic Biology Section are responsible for data collection at these sites. SCDHEC has committed to EPA that all 319-funded implementation projects will be monitored at the associated water quality monitoring site(s) for the life of the project, plus a minimum of two additional years. The data collected are also used to develop project success stories at the request of EPA. For 2020, the sites being collected can be found in Appendix J.

At a federal level, EPA and the US Department of Agricultural Natural Resources Conservation Service (NRCS) have partnered together to direct funding in specific watersheds to improve water quality. The funds are a specific set-aside to the NRCS Environmental Quality Improvement Program (EQIP) and are known as the National Water Quality Initiative, or NWQI. Working together, state NPS and state NRCS programs selected specific watersheds where extensive EQIP funds for agricultural BMPs would be directed. Those watersheds are currently Big Creek – Little Saluda River, Smith Swamp, and Upper Little Saluda River. State NPS programs are required to commit to monitor at least one watershed to help determine the effectiveness of this program, similar to monitoring associated with 319 implementation efforts discussed above. SCDHEC has elected to monitor all watersheds; monthly monitoring will occur at each station (listed in Appendix J) for an array of water quality parameters.

Study plans for these specific monitoring responsibilities are submitted to the QAM annually for approval prior to sampling. All sampling and field analyses are performed according to the most current revision of SCDHEC's <a href="Environmental Investigations Standard Operating Procedures and Quality Assurance Manual">Environmental Investigations Standard Operating Procedures and Quality Assurance Manual</a>) and <a href="Procedures Manual">Procedures Manual</a> for Stream and Wastewater Facility Flow

<u>Measurement</u>. All laboratory analyses are performed according to the most current revisions of SCDHEC's <u>Procedures and Quality Control Manual for Chemistry Laboratories--ARESD</u> and Laboratory Procedures Manual for Environmental Microbiology--ARESD.

#### 3.2 Wetlands Monitoring

SCDHEC has not traditionally conducted ambient monitoring in wetlands, nor do we maintain a network of wetlands sites that are routinely visited and sampled for traditional water quality parameters such as dissolved oxygen, bacteria, nutrients, metals, and organics. However, we have conducted limited monitoring of wetlands and have required limited compliance monitoring by permittees.

## 3.2.1 Compliance Monitoring

When SCDHEC issues a Water Quality Certification for unavoidable impacts to wetlands, the Certification will often have a requirement for compensatory mitigation provided through a mitigation bank or a permittee responsible mitigation site. Both types of sites generally have monitoring requirements to demonstrate success. Typical monitoring consists of requiring each compensation site to be evaluated on a site-specific basis and, if needed, hydrological and vegetative monitoring is required to show the creation, restoration, or enhancement of an area's hydrology or vegetation. Additionally, certain 401 Water Quality Certifications require wetlands compliance monitoring to ensure that the predicted impacts are within expected ranges.

Further, SCDHEC has issued NPDES permits to several wastewater treatment plants where wetlands are the final receiving water. In order to determine if there are detrimental effects of the wastewater on the wetlands, SCDHEC imposes monitoring of the wetland through special conditions of the NPDES permit. Typically, this monitoring consists of ground and surface water quality, vegetation, and hydrological parameters, which are measured bi-annually and reported in an annual report, based on site-specific considerations.

#### 3.2.2 Program Needs

If the State were to implement an ambient monitoring program for wetlands, it would be important to have wetlands water quality standards in place. Perhaps a more difficult obstacle is the resources required to maintain an ambient wetland monitoring program. For this to occur SCDHEC would need additional trained staff to conduct wetland monitoring and assess data.

#### 3.3 Wastewater Discharge Compliance Monitoring

All wastewater dischargers to the surface waters of the State of South Carolina must obtain a National Pollutant Discharge Elimination System (NPDES) Permit. This applies to all public and privately-owned wastewater treatment facilities. The NPDES permit sets limits for physical and chemical characteristics of the facility effluent to protect the water quality of the receiving waterbody. A number of publicly owned treatment works (POTWs) have requirements in their NPDES permits to implement an approved pretreatment program to regulate industrial

discharges, as well.

The purpose of the facility monitoring program is to ensure that permitted effluent limitations are met and properly reported to the State, to ensure proper operation and maintenance of wastewater treatment facilities, and to ensure that the public's concerns and complaints concerning wastewater dischargers are answered effectively. This monitoring function encompasses the review of NPDES permit compliance schedules, review of NPDES self-monitoring data, inspection and evaluation of wastewater treatment facilities, collection and analysis of samples at wastewater treatment facilities, and investigation of complaints concerning wastewater treatment facilities or stream quality throughout the State.

The information gathered by the facility monitoring program is used by the State and EPA to determine permit compliance and to support enforcement actions. Inspection results are also useful in grant reviews and permitting functions. Facility monitoring is often included in water quality assessments, as well.

Certain inspections are used to improve permittee performance through improved data quality and the provision of technical assistance. Of course, the facility monitoring program also serves to maintain a regulatory presence in the State.

The following sections detail the various means at our disposal to accomplish these goals.

## 3.3.1 Compliance Schedule Tracking

Schedules of Compliance for permits and administrative orders are maintained in EFIS as well as a data file designated as the Integrated Compliance Information System or ICIS. ICIS was developed by EPA to track permit compliance and the State has assumed responsibility for maintaining and updating the ICIS database. Compliance staff in the Permit and Data Administration Section conduct a monthly review of permit compliance schedules via reports generated in both EFIS and ICIS. Permit schedule due dates are satisfied in both EFIS and ICIS, and any noncompliance is addressed by both formal and informal enforcement actions.

## 3.3.2 NPDES Self-Monitoring

All NPDES permittees are required to collect and analyze samples of their own effluent at regular intervals for specific permit parameters. Self-monitoring data are transmitted to the Water Pollution Control Division by the permittee in the form of a Discharge Monitoring Report (DMR). The EFIS database is utilized to track NPDES self-monitoring information. For NPDES self-monitoring this system is utilized to assure timely submission of DMRs by dischargers and recording of reported values by effluent parameter for each NPDES permit. DMR files are reviewed on a monthly basis to determine appropriate enforcement action required for failing to submit discharge monitoring reports and/or for significant effluent violations. In addition, permittees are required to report non-compliance covering significant permit violations as they occur. These noncompliance reports, submitted in advance of DMRs, provide DHEC the opportunity to determine if there may be effluent problems requiring immediate investigations. After being logged, reviewed, and entered into EFIS and ICIS by the

Permit and Data Administration Section DMRs are sent to the NPDES file for the particular facility to provide a readily available source of effluent data.

## 3.3.3 <u>Federal Compliance Evaluation Inspections - (CEI)</u>

The Compliance Evaluation Inspection (CEI) is a non-sampling inspection designed to verify permittee compliance with applicable permit self-monitoring requirements and compliance schedules. This inspection is based on record reviews and visual observations and evaluations of the treatment facilities, effluents, receiving waters, etc. The CEI is used for both chemical and biological self-monitoring programs.

# The Inspection

The inspection is comprised of an evaluation of the physical equipment, laboratory records, discharge monitoring reports, and the operational records of the facility. A narrative report is generated summarizing the findings in each of 9 major areas evaluated during the inspection. The 9 major areas evaluated are as follows:

- a. Permit Verification verification of name, address, discharge(s), receiving waters, etc., contained in the permit.
- b. Records and Reports determination of compliance with record keeping and reporting requirements stipulated in the permit.
- c. Facility Site Review examination of areas on the permittee's premises where pollutants are generated, pumped, conveyed, treated, stored or disposed.
- d. Flow Measurement installation, calibration and accuracy of flow measurement system are determined.
- e. Compliance Schedules where applicable.
- f. Self-Monitoring Program sampling frequency, type(s), parameters monitored, parameter limitations, sampling methodology are examined for compliance with permit.
- g. Operation and Maintenance a visual inspection of unit processes is conducted.
- h. Sludge Disposal the permittee's sludge management and disposal methods are evaluated.

Laboratory – a verification of lab certification for the parameters that are analyzed is conducted along with a verification and inspection of field meters.

#### Procedure

The accepted procedure for conducting the Compliance Evaluation Inspection is as follows:

- a. The inspection is conducted unannounced or with limited notification. If contacted ahead of time the permittee is instructed to have available all pertinent records for review.
- b. The evaluator completely fills out the appropriate checklists for each major section evaluated during the inspection.
- c. After completion and review of the inspection report, the narrative report is forwarded to the Water Pollution Compliance Section for review, EFIS and ICIS entry, and distribution.

## Follow-up

Follow-up evaluations will be made on deficiencies noted in initial Compliance Evaluation Inspections. The follow-up is as follows:

- a. A letter emphasizing the deficiencies noted will be sent along with the initial report to the owner. This letter will point out problems found during the inspection and request corrections or plans for corrections. This letter requires a response within fifteen (15) days. Responses are reviewed by Central Office and Regional staff.
- b. Based on the review, the Region may be requested to initiate a follow-up field inspection. The actual follow-up evaluation <u>can be</u> comprised of a routine Facility Evaluation Inspection (FEI) with the emphasis placed on the status of necessary corrective actions to problems noted in the Compliance Evaluation Inspection report.
- c. If corrective action on the initially noted deficiencies has not been taken, the Region should then follow established Enforcement Procedures.

#### 3.3.4 Operation and Maintenance Inspections

These evaluations are designed to ensure that wastewater treatment facilities are being properly operated and maintained in accordance with State and Federal regulations.

The Operation and Maintenance Inspections (O&M) are periodic performed strategically at wastewater treatment facilities in the State. The O&M involves the actual visit to the treatment plant site, a visual inspection of the facility, and a brief records review. The inspector determines if the facility and the equipment involved are properly operated and maintained. Certain limited physical and chemical tests are run on the effluent to help the evaluator determine the plant's efficiency and effectiveness of operation.

The following parameters are collected:

Effluent Temperature pH

## Dissolved oxygen Chlorine residual

The inspection program is not a totally regulatory program. The inspection results are discussed with the operator, when possible, to let him know what corrective measures, if any, are needed.

#### Procedure

The following is the procedure followed for completing a routine facility evaluation:

- 1. Plan work schedule ahead of visits.
- 2. Review file (for previous evaluations, inspections, orders, enforcement action, etc.) and make notes of items that were unsatisfactory on previous visits and carry file or parts needed.
- 3. Review the permit completely.
- 4. Inform appropriate person (immediate supervisor) of your planned daily visits.
- 5. Make every effort possible to contact owner or operator of the facility to be evaluated to inform him of inspection plans. The owner or operator is expected to accompany the evaluator during the evaluation.
- 6. If you are unable to contact owner or operator, obtain access and permission to evaluate facility.
- 7. Make appropriate observations and field tests to determine which processes are satisfactory or unsatisfactory. The facility evaluator must make observations and tests as indicated on the evaluation forms. Effluent tests are mandatory.
- 8. Review the facility's monitoring and permit compliance records. Make comments as appropriate.
- 9. Reports must be completely filled out and signed by person making evaluation. Make appropriate remarks and recommendations. Deficiencies should be listed in remarks section of inspection form.
- 10. Record name of person you contacted. Have him sign inspection form when possible.
- 11. Inform the owner or operator of findings and ask him to make any needed corrections.
- 12. If samples are collected for laboratory analysis, coordination should be made with laboratory and results should be included with evaluation report.

The inspector's reports are reviewed in the region and central office before the copies are

distributed. One copy of the inspection is sent to the facility owner, one copy is kept in the regional office, and the original is sent to Central Office to be reviewed, logged and sent to the permittee and Central Files. Inspection results are entered into the EFIS and into ICIS.

Suspense files on problem facilities should be maintained in the Regional Office. The facility evaluators should also keep a list of facilities that need to be sampled for possible enforcement action. Those lists should be forwarded to the regional monitoring supervisor periodically to be scheduled for sampling.

If the regional staff has exhausted its resources in getting the facility in proper operational condition, then all necessary information concerning the facility can be addressed at a meeting at the Regional level. Necessary enforcement action should follow the established enforcement procedures until compliance is achieved.

## 3.3.5 Compliance Sampling Inspections

Compliance sampling inspections are performed to determine if wastewater treatment facilities are operating as permitted and designed, to collect data for comparison with self-monitoring data, and to support enforcement action.

Sampling of facilities are assigned the following priorities:

- 1. Federal Compliance Sampling Inspections.
- 2. Enforcement Section or EPA requests.
- 3. Engineering Division request.
- 4. Regional personnel request.
- 5. Routine sampling.

## Federal Compliance Sampling Inspections

The Federal Compliance Sampling Inspection requires that an inspection of the facility be conducted by the EA regional facility evaluator. This inspection is to be made on one of the three (3) days required for effluent sampling. A list of the dischargers receiving Federal Compliance Sampling Inspections for each EA region appears in Appendix K.

A detailed inspection of the facility's records, regular operation and maintenance, flow measurement devices, sampling procedures, laboratory, and other permit conditions for compliance verification is conducted by the district facility evaluator. Effluent sampling is included in the Federal Compliance Sampling Inspection. Procedures for sampling the effluent are the same as discussed below for State Minor Compliance Sampling Inspections.

After the sampling and inspection has been completed, the laboratory results are mailed to the Analytical and Radiological Environmental Services Division (ARESD). The narrative reports are entered in EFIS to be processed by the Water Pollution Compliance Section.

## Requested Sampling Inspections

Upon receiving a request for compliance sampling, a review of historical data and the NPDES permit regulations for the facility is conducted to determine if previous sampling data will be sufficient. If additional sampling is needed, a request, including all parameters desired is sent to the Regional Office responsible for sampling that facility. This is coordinated by personnel in the Central Office Water Pollution Compliance Section. A written request for the sampling is then made to the Regional monitoring supervisor. Sampling and reporting procedures are the same as for State Minor Compliance Sampling Inspections (see below).

## State Minor Compliance Sampling Inspections

State Minor Compliance Sampling Inspection schedules are established by the Regional monitoring supervisor. An annual schedule that outlines the month and facility that will be sampled is submitted to the Water Pollution Compliance Section.

The NPDES permit should be reviewed to determine the composite sampling frequency. For those facilities whose composite sample frequency is once per month or less, a one-day composite sample may be collected. Fecal coliform and field parameters should be collected on the day the composite sampler and flow meter are set up, as well as the following day when the composite sample is collected. An updated list of facilities requiring only one day of sampling will be provided to the regional monitoring supervisor annually.

If the NPDES permit requires composite sampling for any parameter at a frequency of greater than once per month, then two days of composite sampling must be conducted. The flow recorder and automatic sampler is set up on the initial sampling day. Fecal coliform and field samples should be collected on the day the composite sampler is set up and on each of the two following days on which composite samples are collected.

In addition to the effluent total residual chlorine (TRC), the chlorine concentration prior to dechlorination should be measured if the effluent TRC is measured to be <0.1 mg/l. These results should be reported on DHEC form 2185, on the line following Sulfides. The monitoring personnel should write  $Cl_2$  in CC on the line below Sulfides, and 66666 as the STORET code.

Samples collected will be taken to the field laboratory for analyses. Samples are collected according to the NPDES permit requirements and the most current revision of SCDHEC's Environmental Investigations Standard Operating Procedures and Quality Assurance Manual.

When sampling these facilities with General Permits (SCGs), the specific type of discharge, as identified in the General Permit, must be written in the space labeled **TYPE** on DHEC form 2185. The correct pipe number, as identified in the General Permit, must also be written in the appropriate space on DHEC form 2185.

After completion of the sample analyses the laboratory data sheets are sent to Analytical and Radiological Environmental Services Division (ARESD) which forwards them to the Water Pollution Compliance Section to be verified, reviewed, and logged in.

The data are edited and a compliance monitoring report (CMR) is generated. The data are compared with the NPDES permit limits to determine if any permit violations occurred. A formal report is then compiled by Water Pollution Compliance Section personnel and sent to the responsible facility official. Copies are transmitted to the Central Office files, the Region, and EPA (majors). A written response to the agency for any significant permit violation is usually requested.

#### 3.3.6 Compliance Biological Inspections

For the purpose of State compliance with the "106 Work Plan" agreement with the EPA, Compliance Biological inspections (CBIs) will be conducted on 10% of major dischargers in conjunction with compliance sampling inspections (CSIs) being conducted by district offices. Discharges to be inspected are selected based on self-monitoring data, requests by department personnel, requests by other parties, and in conjunction with the Federal CSI schedule. Facility records are inspected at the time of Federal and State CSIs. Toxicity test reports and laboratory bench sheets are reviewed to determine if wastewater treatment facilities are in compliance with their NPDES permit WET limits, and to determine the need for permit modifications or enforcement action. CBI's are conducted on 10% of all major facilities that have WET requirements, annually.

#### 3.3.7. <u>Performance Audit Inspections</u>

The Performance Audit Inspection (PAI) is used to evaluate a permittee's self-monitoring program. The purpose of the inspection is not only to determine the quality of self-monitoring but also to assess the reliability of the data reported by the permittee. A field evaluation is conducted which includes an evaluation of flow measurement, sampling, records, and operation and maintenance. Water Pollution Compliance Section personnel perform this part of the PAI. A laboratory evaluation is also conducted which includes a review of analytical methods and procedures, sample handling and preservation, quality assurance, and records. The EA Laboratory Certification Section performs this part of the PAI.

#### 3.3.8 Technical Assistance Evaluations

The Technical Assistance Evaluation (TAE) focuses primarily on wastewater treatment facilities that are not in compliance with their permit requirements. The purpose of the evaluation can be to either evaluate causes of noncompliance in support of enforcement actions or to assist those facilities without self-diagnostic capability. The evaluation identifies major plant deficiencies in operation, design, and/or construction. Other aspects of the permit program such as the permittee's self-monitoring program can be included in the technical evaluation if deemed necessary. These evaluations are performed by the Water Pollution Compliance Section and are done on an as needed basis.

## 3.3.9 Pretreatment Program Audit and/or Inspection

The Pretreatment Program Audit and/or Inspection is conducted according to the schedule

submitted to USEPA which assures that all approved active pretreatment programs receive at least one Audit in each 5-year permit term and at least 2 Inspections during the 5-year permit term. The purpose of the audit and/or inspection is to determine whether the program is being adequately implemented by the POTW. The audit would include a review of the following items:

- 1. POTW treatment facility background information.
- 2. POTW pretreatment program background information.
- 3. Evaluation of POTW pretreatment program changes.
- 4. Legal authority evaluation.
- 5. Application of pretreatment standards.
- 6. Compliance Monitoring and Inspections by POTW personnel in self-monitoring sampling.
- 7. Compliance Monitoring and Enforcement industrial user file review.
- 8. Enforcement Actions by POTW.
- 9. Data management and public participation.
- 10. Program resources review.

The Water Pollution Compliance Section conducts Pretreatment Program Audits or Pretreatment Compliance Inspections on the majority of POTWs with a pretreatment program. Pretreatment follow-up inspections are also performed as appropriate.

The Pretreatment Program Audits are coordinated with POTW facilities whose permit expires in the forthcoming year. During the audit, the inspector observes the industrial user inspection procedures and tours the industrial facility's production process to identify sources of wastewater. A report of the findings is forwarded to the POTW for corrective actions where appropriate.

## 3.4 Complaint Investigations And Fish Kill Program

#### 3.4.1. Complaint Investigations

#### Purpose

The primary purpose for the investigation of complaints is to determine whether or not a pollution or public health threat exists, and to require corrective action where problems are found. Since customer service is a primary focus of the Department, complaint response receives a high priority.

## Strategy

Field staff located in the four regions across the state provide the Department with prompt contact with the complainant, and appropriate response and follow-up as necessary. Complaints received either directly from the public or through other sources will be documented as described below. Voluntary correction of identified problems is often obtained but enforcement action may be taken when necessary under the Pollution Control Act and/or other applicable regulations and laws.

#### Safety

When investigating a complaint, staff safety is top priority. Step one of a complaint investigation should always be for staff to attempt to make contact with the responsible party/property owner prior to visiting the property. A simple phone call can preemptively diffuse a tense or dangerous situation and can alert staff to the need for backup or law enforcement involvement without ever stepping foot on the property.

Coworkers with prior knowledge of the area and online resources such as county maps, aerial photography, and the SC Case Record Search (http://www.judicial.state.sc.us/casesearch/) tool can help identify potential dangers before leaving the office.

No two investigations are ever the same and no training can fully prepare staff for what they may encounter in the field. The key is for staff to be aware of their surroundings and to have a plan for the unexpected. Field staff typically work alone and have to make personal safety judgment calls. Staff are expected to stop any work task that they believe to be unsafe. If staff are uncomfortable with a situation they encounter in the field and fear for their personal welfare or safety, they should politely excuse themselves, leave the property, and contact their supervisor as soon as it is safe to do so.

#### Complaint Investigation Procedure

When possible, complaints should be directed to one of the regional offices that provides coverage over the county in which the complaint is noted (see table 1). Complaints received in the central office will be referred to the applicable regional office for response. Although, complaint investigation and proper documentation to the file are the responsibility of the regional office, central office assistance is available upon request. Discretion and the need to exercise professional judgment are recognized as key components in complaint investigations. The following guidelines are offered to ensure adequate documentation of complaint investigations:

1. Most complaints are entered into the Incidents Module of the EFIS tracking system upon receipt. Stormwater and Ag complaints are documented in epermitting. This provides timely documentation of all complaint investigations. Regional staff must contact the complainant by close of business the next business day after the regional office receives a complaint in order to let the complainant know the complaint has been received and will be investigated. The Department has set an initial response time of 48 hours with a five

day goal to resolve the complaint.

- 2. EFIS/epermitting should be updated no later than COB the next business day after an action is taken (site visit, phone call, etc.) during a complaint investigation. All actions and all communications associated with a complaint investigation, to include final contact with the complainant, must be documented in EFIS/epermitting. Reminder: If a complainant wishes to remain "Anonymous," their contact information should not be captured and they must be informed that they cannot be contacted with investigation results.
- 3. Follow up communication with the complainant or facility/property owner may be in person, by phone, e-mail, or in writing but must be documented in EFIS. Some complaints, by their nature, may necessitate a letter to the complainant or facility/property owner covering the results of the Department's investigations and corrective measures required/taken. (Copies of such letters must be entered into EFIS and stored in the appropriate program files). Poor or incomplete documentation may prevent the Department from taking proper enforcement action.
- 4. To ensure that copies of letters and other documentation can be properly filed, they should be sent to the attention of the appropriate Enforcement Division in the Bureau of Water.
- 5. If staff are verbally denied access to a property or if the property is posted with "No Trespassing" or "Do Not Enter" signs, a magistrate's warrant to enter and inspect the property may need to be obtained. When access is denied, the investigating staff person should immediately contact their supervisor when it is safe to do so. A magistrate may need to be contacted in order to obtain access but a magistrate should not be contacted without involving both regional and BEHS management. The program may also need to be involved prior to contacting a magistrate. Once a warrant is issued, Department staff will conduct the investigation and document the results in writing to the magistrate and the program area. As always, EFIS/epermitting should reflect all actions taken.

## 3.4.2 Fish Kill Program

The Emergency Response Section (ERS) of the Bureau of Environment Health Services (BEHS) of the South Carolina Department of Health and Environmental Control (DHEC) was established to coordinate emergency response activities during oil spills, chemical releases, and fish kills for the Environmental Affairs (EA). The ERS is responsible for the coordination of EA responses regarding emergencies related to water, air, drinking water, solid waste and waste-water. The ERS is also responsible for response and technical assistance regarding other potential threats to environmental health.

The data related to fish kill incidents is collected so that BEHS may coordinate an effective response to acute water quality problems. This data is also available to other bureaus within DHEC for the evaluation of trends regarding the mismanagement of pesticide and herbicide applications, point and nonpoint pollution sources, natural phenomena that may result in environmental stress and assessments regarding environmentally sensitive areas. Additionally, this data is available to interested citizens and private parties and other government agencies (i.e.: the *South Carolina Department of Natural Resources* [DNR] and the *National Oceanic and Atmospheric Administration* [NOAA]). All reports regarding fish kill incidents are entered into and maintained within the *DHEC Environmental Facility Information System* (EFIS).

A rapid initial response is often essential to an effective investigation regarding a fish mortality incident. Therefore, the 24-hour/toll-free *Emergency Response Telephone Number*, 888-481-0125, is available for the reception of reports regarding the occurrence of fish kills. Monday through Friday, between the hours of 8:30 a.m. and 5:00 p.m., this number is managed directly by the *ERS Central Office Duty Officer* (CODO). The CODO coordinates response activities in cooperation with the *Regional On-Scene Coordinator* (ROSC), of the appropriate *EA Regional Office*, hereafter referred to as Field Office, where the incident occurred. After business hours and on weekends, the *Emergency Response Telephone Number* is managed by the operators in the State Warning Point (SWP) which operates at the *South Carolina Emergency Management Division* (SCEMD). The SWP operators then communicate the information in the initial report to the CODO. The CODO will coordinate a response to the incident. Additionally, fish kill incidents reported directly to the REGION are also communicated to the CODO in order to ensure the effective coordination of all investigative responses.

During an investigative response to a fish kill report, a field assessment is conducted to collect relevant information. This information will assist in determining the level of response required. In cases where an investigator is deployed to the incident site, the ROSC is the person who conducts the initial assessment and determines what response actions are necessary. The responsibilities associated with the position of ROSC are assigned to personnel within each of the 13 Field Offices. Each Field Office maintains the equipment necessary to conduct fish kill investigations; including, but not limited to: ice chests, global positioning system cameras, 800 MHz radios, and specimen preservatives and containers for bacteriological, biological and chemical samples.

Because a legal liability may be associated with a fish kill incident, each Field Office also possesses the most current version of the *DHEC Field Manual for the Investigation of Fish Kills*. This document provides procedures for conducting fish kill investigations. The *DHEC Field Manual for* 

the Investigation of Fish Kills also provides procedures for response actions regarding harmful algal blooms. Additionally, EA personnel frequently participate in educational opportunities related to fish kill incidents in order to increase their knowledge of the conditions and dynamics and to improve the efficacy of DHEC investigative responses.

The distribution of responsibilities throughout the Field Offices enables an efficient response by decreasing the distance between the ROSC and the incident location; this reduces response time and increases the possibility of determining the cause of the fish kill. Field Office personnel, ROSCs, are often familiar with the incident locations and local resources available in the area. This familiarity also lends itself to an increased level of awareness and understanding of the variables present in the local ecosystem.

Each Field Office collaborates with the local DNR personnel when conducting fish kill investigations. The familiarity between the DHEC EA personnel and local DNR personnel is increased through the frequent coordination and responses at the local level. The *DNR Wildlife and Freshwater Fisheries Division* participates in the management of fish kill incidents that occur in freshwater conditions. The *DNR Marine Resources Division*, located in Charleston, participates in the management of fish kill events that occur in saline waters. The *DNR Law Enforcement Division* also maintains a 24-hour/toll-free telephone number, 800-922-5431, for emergencies requiring immediate law enforcement assistance.

For cases in which a fish kill incident is potentially related to a release of fertilizers, herbicides or pesticides, the DHEC personnel coordinate response actions with personnel from the *Clemson University Department of Fertilizer and Pesticide Control*. If such an official is unavailable, the *ERS Fish Kill Coordinator* is notified of the event. If necessary, samples may be delivered to the *DHEC Division of Analytical and Radiological Environmental Services (ARESD)*. The ARESD is capable of conducting a laboratory analysis of samples collected during a fish kill investigation; with the exception of biological specimens.

The extent of any specific fish kill investigation is dependent upon a number of variables. Those variables include, but are not limited to, the number and types of fish affected, the characteristics of the body of water and the resources available for response actions. Although delayed reporting of a fish kill event can diminish the ability to determine an outcome, an investigation is conducted to identify potential issues related to environmental health regardless of the length of the time that has elapsed since the incident occurred. Fish mortality incidents may result from a variety of natural and unnatural causes. The investigation into a given fish kill should continue until a cause is identified or until the significance of all potential environmental health threats, such as a contamination resulting from a release of chemicals, oil or other pollutants, is eliminated. For cases in which the cause of a fish kill is determined to be related to human activities, a report is submitted to the *Division of Water Monitoring, Assessment and Protection* of the *EA Bureau of Water* for potential enforcement actions regarding relevant regulations.

## 3.5 Public Water Systems Monitoring

The monitoring schedules and requirements are included in the National Primary Drinking Water Regulations of the Safe Drinking Water Act as amended in 1986 for Phases I, II, IIB, and V. Also, included in this Act are the Lead and Copper Rule, Revised Total Coliform Rule, and the Surface Water Treatment Rule. The enclosed numbers are a summary of the required drinking water monitoring for CY 2020. A description of the sampling compliance cycles and monitoring parameters is included to show where time and effort are focused. The waivers, scheduling, collection, shipment, and analyses are conducted by the South Carolina Department of Health and Environmental Control (Department) Bureau of Water staff, Analytical and Radiological Environmental Services Division (ARESD) staff, and contracted private laboratories.

## 3.5.1 Microbiological

## Required and Repeat Monitoring: Distribution Monitoring

The microbiological monitoring program is based on the Revised Total Coliform Rule and Groundwater Rule. The Revised Total Coliform Rule (RTCR) requires all federally defined public water systems to develop a self-monitoring program for their system. The Groundwater Rule requires all federally defined systems that detect total coliform in their distribution system to collect a sample from each source in use at the time of the total coliform positive. To be classified as a federally defined public water system, the system must meet specific criteria. These criteria are as follows:

- 1. A Community water system services a minimum population of twenty-five (25) year-round residents or has at least fifteen (15) service connections in use year-round.

  OR
- 2. A Transient Non-Community water system has at least 15 service connections or serves an average of 25 or more people a day, though not the same people each day (i.e. restaurants, rest stops, campgrounds).

  OR
- 3. A Non-Transient Non-Community water system regularly serves at least 25 of the same people over six months per year (i.e. schools, factories, and offices).

A State water system is defined as any water system that serves less than 15 service connections or regularly serves an average of less than 25 individuals daily. Department staff collects quarterly/monthly/annual samples, as required, from the distribution system of this type of water system. Repeat samples are required for each total coliform or *E. coli* positive routine sample as per the rule.

The Department also collects, for mandated compliance monitoring, quarterly/monthly/annual bacteriological samples from the transient non-community water systems. These samples are collected as part of the services included under the Drinking Water Fees. Repeat sample sets are collected for these systems, as required in RTCR. The repeat sets consist of three distribution samples and the source samples for those source(s) in operation at the time of the total coliform or *E*.

coli positive routine sample.

Migrant camps are monitored during the months they are in operation.

Non-Routine: Distribution Monitoring of Public Water Systems

Non-routine samples are special samples that may be collected due to complaints on a public water system. Department personnel will collect bacteriological samples from residences where complaints have been filed. Also, if there have been line breakages, line repairs, or extensions, samples may be collected to determine water quality and disinfection residual. Special project samples are included in the non-routine (non-required) program area. Special project samples encompass samples collected in defining an area of contamination, potential contamination, and investigations. These samples may be from public water systems or private wells.

## 3.5.2 <u>Inorganic Chemicals (IOCs)</u>

#### Required and Repeat Monitoring: Source Monitoring

Routine inorganic sample analysis includes the following compounds: arsenic, barium, cadmium, chromium, fluoride, mercury, selenium, antimony, beryllium and thallium. Inorganic monitoring applies to community systems and non-transient non-community systems. There are two schedules for IOCs: one (1) routine sample each calendar year (CY2020) for surface water systems; and one (1) routine sample every three (3) years for groundwater systems (January 2020-December 2022). Any system exceeding a Maximum Contaminant Level (MCL) shall be monitored quarterly beginning in the next quarter after the initial MCL exceedance. The quarterly monitoring may decrease if the system is reliably and consistently below the MCL to one sample at each sampling point during each compliance period for groundwater systems and one sample annually at each sampling point for surface water systems. There are currently one thousand eighty-eight (1088) systems being monitored for IOCs in CY2020 – CY2022. There are fifty-two (52) surface water sources/plants and one thousand thirty-six (1036) groundwater sources/plants being monitored for IOCs in CY2020 – CY2022. Currently there are approximately three hundred seventy-six (376) sources/plants representing two hundred fifteen (215) systems that will be monitored for IOCs during the CY2020.

#### Required Lead and Copper Monitoring: Source and Distribution Monitoring

Community and Non-Community Non-Transient water systems must monitor for lead and copper. Initial sampling is in the distribution system. If the initial two rounds (2 consecutive 6-month sampling periods) of sampling are below the action levels for lead (0.015 ppm) and copper (1.3 ppm), the system may be placed on reduced monitoring. Reduced monitoring is conducted on an annual basis during the months of June, July, August, and September. The system is required to collect half the number of samples of the initial round. Five (5) samples per system is the minimum number of samples that may be collected for initial and reduced monitoring. If three consecutive rounds of reduced monitoring for the system are below the action levels for both lead and copper, the system may be placed on the ultra-reduced monitoring schedule. The systems on ultra-reduced must collect a reduced sampling round once every three years. Should a water system exceed the action

level for lead, copper, or both, the water system must conduct an Optimal Corrosion Control Treatment (OCCT) study. In addition, system(s) must do water quality parameters and public education (lead only). They may continue sampling on a six-month sampling cycle. OCCT requires source monitoring for all sources within the system. A water system may continue to monitor for lead and copper during the OCCT study. If during the OCCT study period, two consecutive rounds of lead and copper monitoring are below the action levels for both lead and copper, the system may be taken off OCCT and placed on the reduced monitoring schedule.

## Required Nitrate and Repeat Monitoring: Source Monitoring

Currently there are one thousand forty-four (1,044) water systems that must be monitored for nitrate. There are fifty-two (52) surface water sources and one-thousand five hundred sixty-five (1,565) groundwater sources/plants that must be monitored.

Each public water system must be monitored on an annual basis for nitrate. Repeat monitoring frequency shall be quarterly for at least one year following any one sample in which the concentration is 50 percent or more of the MCL. The schedule may be reduced to annual monitoring after four consecutive quarterly samples are reliably and consistently less than the MCL.

Migrant camps should be monitored prior to their opening.

## Non-Routine/Special Projects (Investigation): Source, Distribution Monitoring

These samples are collected due to citizen complaints regarding a public water system or potential health hazard. These samples are not for compliance determination, but to help detect and correct any problem areas noted by the water systems' customers. These samples are part of the Department's public service commitment to investigate any public water complaint and address them accordingly. Special project samples are considered to be investigative sampling. Compliance issues may be raised from the samples and actions are taken accordingly.

# 3.5.3 Synthetic Organic Compounds (SOCs)

SOCs consist of forty-nine (49) regulated and unregulated compounds. All community and non-transient non-community public water systems require an initial four (4) consecutive quarters of monitoring. If at the end of the four consecutive quarters of monitoring no contaminant had a reading of greater than or equal to the detection limit, then the source is placed on routine monitoring. Once initial monitoring has been completed a system will have its schedule adjusted. If a contaminant result is greater than or equal to the detection limit the system must continue with four additional consecutive quarters of monitoring until the sampling is reliably and consistently below the detection limit. There are three different schedules for SOCs: one (1) routine sample each calendar year (CY2020) for surface water systems; one (1) routine sample every three (3) years for groundwater systems with a population of greater than 3,300 (CY2020-CY2022) and one (1) routine sample every nine (9) years for groundwater systems with a population of less than or equal to 3,300 (January 2020-December 2028). Currently there are approximately two hundred (200) sources/plants representing eighty-nine (89) systems that will be monitored for SOCs during the CY2020.

## 3.5.4 <u>Volatile Organic Compounds (VOCs)</u>

VOCs consist of twenty-one (21) regulated contaminants and thirty-eight (38) unregulated contaminants. All community and non-transient non-community public water systems require an initial four (4) consecutive quarters of monitoring. If at the end of the four consecutive quarters of monitoring no contaminant had a reading of greater than 0.0005 mg/L then the source is placed on routine monitoring. Once initial monitoring has been completed a system will have its schedule adjusted. If a detection level is exceeded the system must continue with four additional consecutive quarters of monitoring until the sampling is reliably and consistently below the MCL. There are two schedules for VOCs: one (1) routine sample each calendar year (CY2020) for surface water systems; and one (1) routine sample every six (6) years for groundwater systems (January 2020-December 2025). Currently there are approximately two hundred forty-four (244) sources/plants representing one hundred fifty-four (154) systems that will be monitored for VOCs during the CY2020.

#### Non-Routine: Source or Distribution Monitoring

All non-routine VOCs would be collected on a complaint basis or as part of an investigation. These samples may be collected in coordination with landfills, gas stations, and petroleum storage tanks. The Drinking Water Monitoring Section, the Regional EA offices, and other Bureaus within the Agency may require special projects involving VOC samples to be collected and analyzed.

## 3.5.5 Total Trihalomethanes (TTHMs): Distribution Monitoring

Total Trihalomethanes (TTHMs) are a byproduct of drinking water disinfection. Community water systems and Non-community, non-transient water systems utilizing treated water in whole or in part are required to monitor for TTHMs. Compliance (routine) monitoring is based upon source water type and the population served.

In CY2019, approximately four hundred fifteen (415) water systems will be monitored for TTHMs.

## 3.5.6 <u>Haloacetic Acids (HAAs):</u> Distribution Monitoring

Haloacetic Acids (HAAs) are a byproduct of drinking water disinfection. Community water systems and Non-community, non-transient water systems utilizing treated water in whole or in part are required to monitor for HAAs. Compliance (routine) monitoring is based upon source water type and the population served.

In CY2019, approximately four hundred fifteen (415) water systems will be monitored for HAAs.

## 3.5.7 Radionuclides: Source Monitoring

Community water systems are required to monitor for radionuclides, which include gross alpha, radium-226, and radium-228. Radium-226 will be analyzed for based on the gross alpha level. Radium-228 will be monitored for all samples collected. Monitoring for radionuclides falls

under the new Radionuclide rule which requires monitoring to be collected from the source rather than the distribution system. During CY2020 approximately two hundred fifty (250) sources/plants will be monitored.

Table 4. Projected Public Water System Sample Numbers for CY 2020

Micro	biological	
1.	Required Sampling	2,420

#### 4.0. PROGRAM EVALUATION AND PLANNING

The South Carolina ambient monitoring strategy as described in this document represents a comprehensive approach to address the goals and objectives discussed in Section 1. The Strategy is updated each year, and as part of that process each program represented in the Strategy conducts a thorough review of their continuing monitoring activities. This review includes an evaluation of new initiatives and emerging issues and provides the opportunity to incorporate changes to the monitoring activities to ensure that those are addressed.
